MISCELLANEOUS

THE SPECIALIST IN OVERVOLTAGE PROTECTION

With a thorough understanding of local standards and regulations, along with continuous investment in R&D, CITEL designs, manufactures and sells millions of SPD's each year.

CITEL develops many critical protection components internally. Our teams all over the world are proud to help bring the market a comprehensive product range of surge protectors with our unique client-focused service & quality.

CITEL's only business and expertise is to protect networks and equipment from transient overvoltages, in particular those induced by lightning. For this, CITEL manufactures two complementary products lines:

- **Gas discharge tubes** (or GDTs) are the basic passive components used to protect telephone exchanges and equipment from voltage surges; they are generally installed on telephone networks by telecommunication operators.

- **Surge Protection Devices** (or SPDs) are units combining several protection components. They may be used by the installer or by the end customer. They are designed to be incorporated in an installation to protect all electric, electronic, and data-processing equipment from transient overvoltages.

CITEL: best-in-class service quality

From the technical expertise to the operational deployment, we are passionate about all aspects and topics related to SPDs.

Our teams are composed of engineers and SPD specialists who can bring forward the best insights and solutions. Our technical and sales teams around the world are organized to share experience and knowledge.

Our teams place the user at the heart of their practise. Providing advice and training to their clients, they strive to bring the most appropriate product solution. Our local teams master both the language and the market specifics.

Our logistic: flexible, trustworthy and committed, reassures our customers.

CITEL

OURS MEANS OF TESTS

3 LABORATORIES...

CITEL constantly pioneers new technologies thanks to a bold innovation strategy, high-level R&D and in-house regional test labs around the world.

CITEL is recognized as an industry leader that is instrumental in the development of international codes and standards.

In order to test its products internally for standards compliance and to evolve toward greater reliability CITEL has several centers of expertise and research(France, USA, China) equipped with :

- Various transient surge current and surge voltage generators such as 8/20, 10/350,10/1000, 1.2/50...
- AC and DC Power Sources for short circuit and load current tests with possible superimposed and synchronized pulses for AC sources.
- Various equipment's for environmental tests (impact, vibration, climate, damp, fire...)

The G100K test generator in Reims (France) can produce exceptionally high impulse current of 100 kA and is used for testing structural lightning protection systems as well as Type 1 surge protectors.

Tests capacities are dedicated to electrical equipement generally and specifically to surge protection. We are using the following standards :

- IEC/ EN 61643-XXY
  -11, -21, -31 and -41*
  -311 and -331
- IEC/EN 610004-5
- NFC 17-100 and -102
- NF EN 50164-6 and IEC 62561-6 (as well as all the tests in surge currents pulses of these series of standards)
- UL1449, UL497B, UL497E
- ITU K12
- IEEE C62.31, C62.33, C62.35, C62.45
- ANSI C136.2
- etc...

Test facilities and benches are made to be polyvalent and CITEL teams of experts can also realize custom-made tests (out of standards)

In 2017, Shanghai lab has been equipped with a very high energy surge generator able to produce 240 kA in 8/20µs impulse.

Since 2019, our Shanghai Laboratory has received a CERTIFICATE OF APPROVAL for Customer's Testing Facility, for the testing of electrotechnical equipment and components under the IECEE System.

It has been approved by Dekra at Stage 2.

CITEL PROTECTS OUR PLANET

Besides our constant work on the quality of our products, we take into account the ecological issues of our planet.

This is why CITEL is working to optimize its production equipment in order to reduce the impact on the environment. We have chosen for our new range high quality raw materials.

Our products use **Halogen free** material and comply with **RoHS** regulations.
CITEL is **ISO 14001** certified and meet the requirements of the **WEEE** directive.

COMMITMENT FOR RECYCLING

TRANSIENT OVERVOLTAGES

An electrical network generally has a normal voltage: we also speak of nominal voltage. The network can be accidentally brought to a voltage higher than its nominal voltage: this is called overvoltage or surge voltage, if this one is very short. One of the possible causes of electrical or electronic equipment failure are the surge voltages .

WHAT IS THE ORIGIN OF AN SURGE VOLAGE ?

Surge voltages differ in amplitude, duration and frequency. While protection against power surges caused by lightning or switching will require the use of surge protective devices (SPD), «ESD» or «IEMN» issues are far more specific and require other adapted solutions.

SURGE VOLTAGE DUE TO LIGHTNING STRIKE

The users of electric, electronic equipment and telephone and data-processing systems must face the problem of keeping this equipment in operation in spite of the transient overvoltages induced by lightning.
Lightning, investigated since Benjamin Franklin's first research in 1749, has paradoxically become a growing threat to our highly electronic society.

Lightning formation

A lightning flash is generated between two zones of opposite charge, typically between two storm clouds or between one cloud and the ground. The flash may travel several miles, advancing toward the ground in successive leaps: the leader creates a highly ionized channel. When it reaches the ground, the real flash or return stroke takes place.
A current in the tens of thousands of Amperes will then travel from ground to cloud or vice versa via the ionized channel.

Direct effects of lightning

At the moment of the discharge, there is an impulse current flow that ranges from 5,000 to 200,000 Ampere peak, with a rise time of about few microseconds.

- Impact on buildings: Falling objects, property damages, fire starts
- Impact on living beings: Lightning strike mortality of 10,000 people per year worldwide and from 10 to 20 people per year in France
- Phenomenon of step tension: Lightning can indirectly kill by striking nearby: in fact around the point of impact it creates a displacement of electric charges with a certain electric potential. The difference in potential (voltage) between two points is even greater as the difference between these two points is great. The higher this voltage, the more intense current can circulate in a living organism (electrocution) by the members in contact with the ground. This phenomenon is called "step tension", higher for a large quadruped oriented towards the point of impact, than for a human being. Thousands heads of cattle are victims of lightning each year.

This direct effect may be considered as a small factor in damaging electric and electronic systems, because it is highly localized.

The best protection is still the classic lightning rod or Lightning Protection System (LPS), designed to capture the discharge current and conduct it to a particular point.

Indirect effects of lightning

Impact on overhead lines

Such lines are very exposed and may be struck directly by lightning, which will first partially or completely destroy the cables, then cause high surge voltages that travel naturally along the conductors to line-connected equipment. The extent of the damage depends on the distance between the strike and the equipment.

Rise in ground potential

The flow of lightning in the ground causes earth potential increases that vary according to the current intensity and the local earth impedance. In an installation that may be connected to several grounds (e.g. a link between buildings), a strike will cause a very large potential difference and equipment connected to the affected networks will be destroyed or severely disrupted.

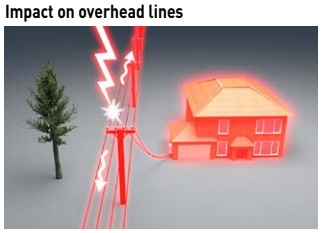
Electromagnetic radiation

The flash may be regarded as an antenna several miles high carrying an impulse current of several tenth of kilo-amperes, radiating intense electromagnetic fields (several kV/m at more than 1 km).
These fields induce strong voltages and currents in lines near or on equipment. The values depend on the distance from the flash and the properties of the link.

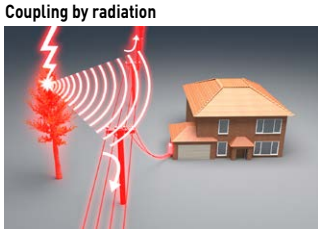
Direct impact

Rise in ground potential

Impact on overhead lines



Coupling by radiation



INDUSTRIAL AND SWITCHING SURGES

This term covers phenomena caused by switching electric power sources on or off.

Surges due to switching operations are caused by:

- Starting motors or transformers
- Neon and sodium light starters
- Switching power networks
- Switch «bounce» in an inductive circuit
- Operation of fuses and circuit-breakers
- Falling power lines...

These phenomena generate transients of several kV with rise times in the order of a few microseconds, disturbing equipment in networks to which the source of disturbance is connected.

ELECTROSTATIC OVERVOLTAGES (ESD)

Electrically, a human being has a capacitance ranging from 100 to 300 picofarads, and can pick up a charge of as much as 15kV by walking on a carpet, then touch some conducting object and be discharged in a few nanoseconds, with a current of about ten Amperes. All integrated circuits (CMOS, etc.) are quite vulnerable to this kind of disturbance, which is generally eliminated by shielding and grounding.

NEMP PHENOMENA

(Nuclear ElectroMagnetic Pulses)

A high-altitude nuclear explosion, above the atmosphere, creates an intense electromagnetic field (up to 50 kV/m in 10ns), radiated to a ground area up to 1200 kilometers in radius.

In the ground, the field induces very large transient overvoltages in power and transmission lines, antennas, etc., destroying the terminal equipment (power circuit, computer terminals, telephone equipment, etc.).

The field rise may reach several kV/ns. While it is difficult to eliminate all overvoltages induced by an electromagnetic pulse, there are ways to reduce them and strengthen the systems to be protected. In spite of the amplitude of the phenomenon, protection can be provided by shielding and filtering/surge protection adapted to NEMP.

CONSEQUENCES OF SURGE VOLTAGES

The lightning incident is relatively common. Statistically, the share of damage caused by lightning on computer equipment is far from negligible.
The consequences of a disturbance are not always visible and immediate. The weakening of a component by an overvoltage can lead to a reduction in the lifetime of the equipment, or a 'deferred' failure. The user can therefore not make the link between the failure and the real cause. He will hasten to establish a bad diagnosis, therefore a bad treatment of the problem.

Overvoltages have many types of effects on electronic equipment; in order of decreasing importance:

Destruction
- Voltage breakdown of semiconductor junctions
- Destruction of bonding of components
- Destruction of tracks of PCBs or contacts
- Destruction of triacs/thyristors by dV/dt.

Interference with operation
- Random operation of latches, thyristors, and triacs
- Erasure of memory
- Program errors or crashes
- Data and transmission errors

Premature ageing
Components exposed to overvoltages have a shorter life.

The consequences of lightning strikes on installations are real since the standardization of electrical installations now makes the installation of SPDs compulsory in certain cases

SURGE PROTECTION DEVICES

The Surge Protection Devices (or SPD, generic name for any device to protect from voltage surges) is a recognized and effective solution for the overvoltage problem. For greatest effectiveness, however, it must be chosen according to the risk and installed in accordance with the applicable standards.
The SPDs are made of several types of components, like GDT (Gas Discharge Tube), GSG (Gas Spark Gap), MOV (Metal Oxyde Varistor), SAD (Silicon Avalanche Diode), depending of the applications or the performances to reach.
As all types of networks could be stressed by surge voltages, SPDs are available for AC power, DC power, PV power, Telecom & Datalines, LAN and Radiocommunication lines.

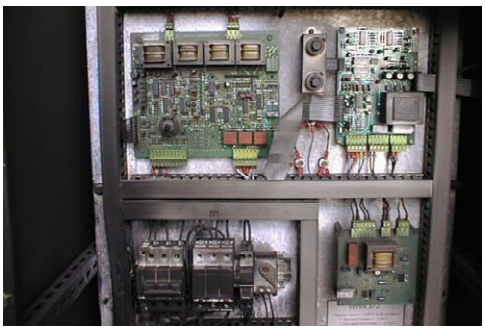
STANDARDS

Because of the diversity and importance of transients, standards organizations have created specifications for testing the effects of overvoltages on equipment.
The phenomena were first characterized and a series of standardized waves created (1.2/50µs voltage wave and 8/20µs or 10/350µs current waveforms), then a number of standards defining surge arrester performance were issued, among them :

Surge Protectors for AC installations :
- NF EN 61643-11 (France)
- DIN EN 61643-11 (Germany)
- EN 61643-11 (Europe)
- UL 1449 (USA)
- IEC 61643-11 (International)

Surge Protectors for PV installations :
- EN 61643-31 (Europe)
- IEC 61643-31 (International)

Surge Protectors for Telecom equipment :
- IEC 61643-21 (International)
- ITU-T recommendations K11, K12, K17, K20, K21, K36 (Int.)
- UL 497 A/B (USA)



CITEL

DIN RAIL
AC POWER
SURGE PROTECTORS

DIN RAIL AC POWER SURGE PROTECTORS

CITEL AC power Surge Protective Devices (SPD) are designed to meet all your surge protection needs for any low voltage installation.

These DIN rail mounted surge protectors are easy to install in any standardized distribution panel or control cabinets. The SPDs are equipped with a thermal disconnection device and provide real-time fault indicators thus allowing complete operational safety.

DS and DAC surge protectors are available with several protection circuits to comply with even the most demanding installations and standards compliance requirements.

CITEL AC power surge protectors offer three levels of surge protection capacity that correspond to the different IEC or EN classes, i.e. Type 1, Type 2 or Type 3.

STANDARDS

To ensure efficient and reliable performances, all CITEL's AC power surge protectors comply with the leading standards.
Relevant standards in the AC surge protection field could be split into 3 types of documents:

«Product» standards :
These documents address the type of tests the SPD manufacturer must apply on its devices :
- Europe : EN 61643-11
- Germany : DIN EN 61643-11
- International : IEC 61643-11
- USA : UL1449-5ed

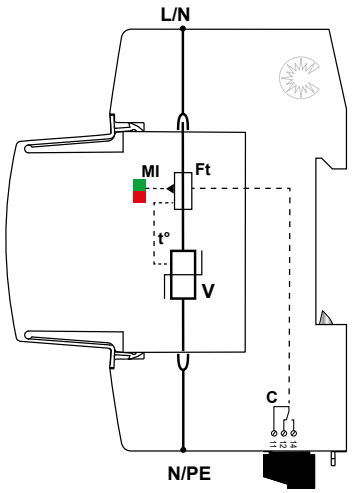
«Installation» standards :
These documents give the main information about AC power surge protectors and their proper installation:
- International : IEC 61643-12 guide
- Europe : CLC/TS 61643-12
- USA : IEEE C62-41

«Selection» standards :
They define the basic rules to select the surge protector in accordance with the general electrical code :
- International : IEC 60364-4-433 and 5-534
- Europe : HD 60364 -4-443 and 5-534
- USA : NEC art. 280 & 285

OPERATING PRINCIPLE

CITEL surge protectors for AC network are based on zinc metal-oxide varistors (MOV), the best compromise between a fast response time (<25 ns) and a high discharge current capacity, which are the main parameters to provide efficient protection.
Nevertheless the end of life of these varistors must be absolutely monitored thus requiring the systematic use of built-in thermal disconnection devices (see «Disconnection devices»).

DAC50 surge protector diagram



V : Varistor
Ft : Thermal fuse
t° : Thermal disconnection
C : Remote signaling contact
MI : Disconnection indicator

VG TECHNOLOGY BY CITEL

In order to improve the surge protection efficiency, CITEL has developed a patented technology which combines a high energy varistor (MOV) network and a specific gas tube (GSG). This specialized circuit incorporated in the «VG» Type "1+2+3" surge protectors (DAC1-13VG, DS250VG, DUT250VG) or Type "2+3" (DAC50VG) can achieve better performance of:

- Protection level,
- Life duration (due to suppression of leakage current),
- Non-disturbing operation (no follow current)
- TOV behavior.

For instance, these features allow it to reach, even with a single stage of surge protection, the same protection efficiency as a double stage association (Type 1, Type 2 and Type 3 SPDs) (see page 13).

SURGE PROTECTORS PARAMETERS

Surge protectors are defined by a series of electrical specifications which will help the user to select the right protection specific to their installation:

Operating voltage - Uc

The maximum continuous operating voltage (MCOV) Uc is the maximum AC voltage which may be applied continuously to the SPD, with safety margin.

Temporary overvoltage - U_T

The temporary overvoltage U_T (TOV) is the maximum AC voltage the surge protector can withstand during defined durations (5 seconds and 120 mn), without failure or with controlled disconnection. This parameter U_T is greater to Uc.

An additional test is required for TT AC system, to simulate a temporary «high voltage» overvoltages (TOV) between Neutral and PE (application of 1200 Vac, 300 A for 200 ms): the compliance with this test requires the use of the CT2 diagram (specific gas tube between N and PE).

Discharge current - In and Imax

The maximum discharge current (Imax), applicable to Type 2 SPD, is the maximum impulse current 8/20 µs a surge protector can withstand without destruction .

The nominal discharge current (In) is the level of 8/20 µs impulse current a surge protector Type 1 or Type 2 can withstand repeatedly (15 surges) without destruction.

Impulse current - Iimp

The impulse current (Iimp), used in Class I test applicable to Type 1 SPDs, is the maximum impulse 10/350 µs current a surge protector can withstand without destruction. This test simulates the effect, on AC power surge protectors, of a direct lightning strike on an installation.

Total discharge current - Itotal

Total discharge current flowing in the PE or PEN conductor of a multipolar surge protector.

Specific energy - W/R

Energy discharged during the flow of the surge current Iimp, during the Class I test. Expressed in kJ/ohm.

Open circuit voltage - Uoc

This parameter is used only for Class III test, applicable to Type 3 SPD and consists of the injection of a combination wave (1.2/50 µs in open circuit - 8/20 µs in short circuit).

Protection level - Up

Maximum residual voltage of the surge protector during an 8/20µs current injection with the declared rating of the In or Iimp currents (or during a 1,2/50µs @ 6kV impulse voltage test, if required).

Residual voltage

Residual voltage of the surge protector during an 8/20µs current waveform injection at a determined rating (i.e 5 kA).

Short circuit current capability - Isccr

The surge protection and its associated disconnector (Fuse) are tested to disconnect safely on a maximal short circuit current value (i.e.: 50 kA) : This Isccr value needs to be higher than the short circuit current value of the network at the installation point.

Follow on current extinction capability - Ifi

This criteria is only devoted to surge protection using the "air gap" technology : once they have fired, these surge protectors conduct part of the network current (follow on current) and need to interrupt it. This behavior does not concern AC power surge protector using Metal Oxide Varistor technology.

DIN RAIL AC POWER SURGE PROTECTORS

TYPE OF SURGE PROTECTORS

The AC power surge protectors are split into 3 categories by IEC 61643-11 and EN 61643-11 standards, following 3 classes of tests. These different tests depend on the location of the surge protector in the AC network and on the external conditions.

Type 1 surge protectors

Type 1 surge protectors are designed to be installed when a direct lightning strike risk is high, especially when the building is equipped with external lightning protection system (LPS or lightning rod). In this situation, EN 61643-11 and IEC 61643-11 standards require the Class I test to be applied to surge protectors : this test is characterized by the injection of 10/350 µs impulse current in order to simulate the direct lightning strike consequence. Therefore these Type 1 surge protectors must be especially powerful to conduct this high energy impulse current.

Type 2 surge protectors

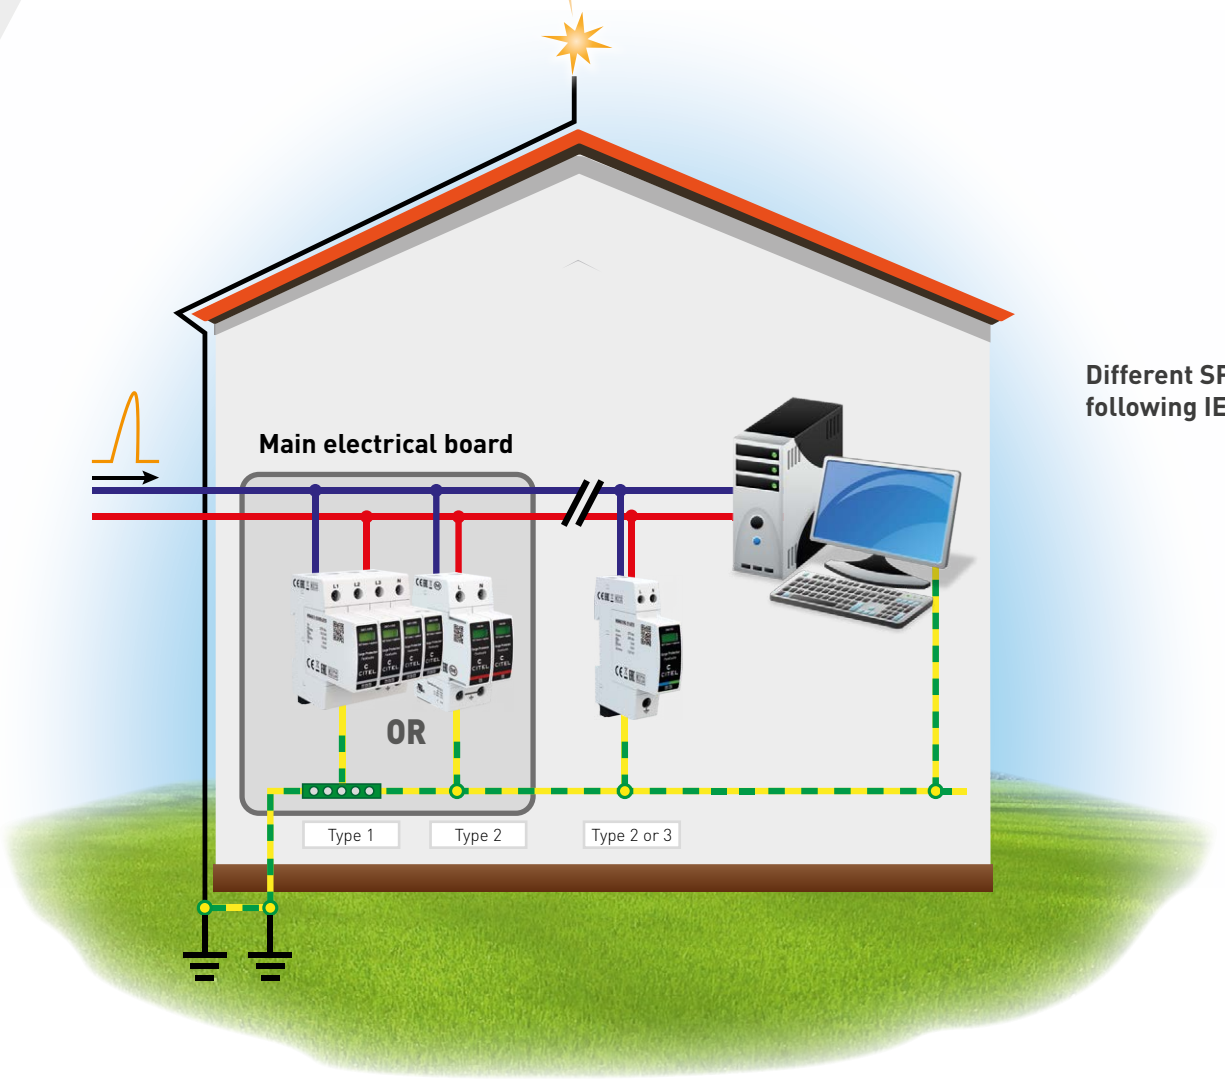
Type 2 surge protectors are designed to be installed at the entrance of the installation, in the main switchboard, or close to sensitive equipment, on installations without LPS (lightning rods). These protectors are tested following the Class II test from IEC61643-11 or EN61643-11 standards and based on 8/20 µs impulse current injection.

Type 3 surge protectors

In case of very sensitive or remote equipment, secondary stage of surge protectors is required : these low energy SPDs could be Type 2 or Type 3 (see «Coordination of surge protector» page 20). Type 3 SPDs are tested with a combination waveform (1,2/50 µs - 8/20 µs) following Class III test.

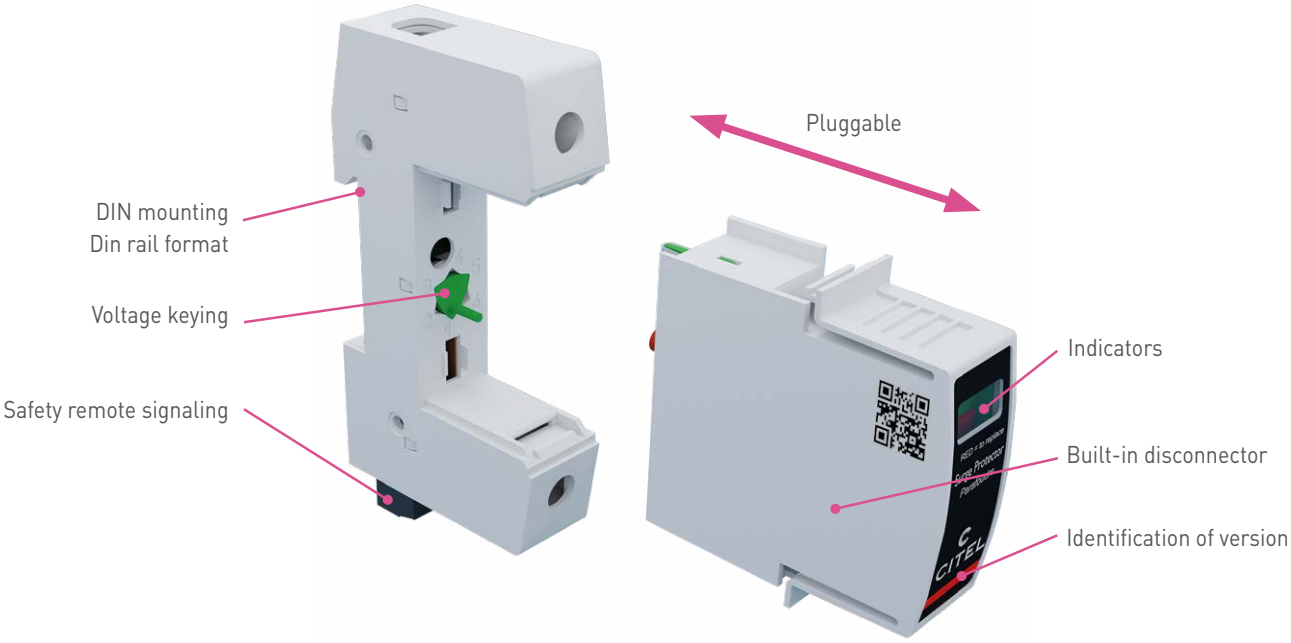
Surge protector combination

Surge Protectors incorporating VG technology provide protection equivalent to a coordination of a Type 1 + Type 2 + Type 3 surge protectors. Advantages: reduces the cost and time of installation. Simplifies selection (no calculation of coordination) (see page 15-16).



Different SPD types following IEC and EN standards

AC power Surge Protector DAC50



DISCONNECTION DEVICES

In compliance with the standards, the AC power surge protectors are equipped with internal disconnection devices and associated to external devices, in order to provide total safety in case of failure.

2 types of devices are necessary :

• **Internal thermal security** which will disconnect the surge protector from the AC network in case of thermal runaway. In such a case, the user will be warned about the trouble by an indicator in front of the protector and will carry out the replacement of the defective SPD.

• **External electrical disconnection** (fuses or breaker) to disconnect the surge protector from the AC network in case of internal short circuit, e.g. due to an excessive impulse current. The rating of the external fuses are in relation with the discharge capability of the SPD and the prospective short-circuit current of the installation and must be tested together with the surge protector in order to ensure compliance of the short-circuit current withstand test (Isccr parameter). To ease the selection of these components, the rating and type of fuses are mentioned in the datasheet and in the installation instructions of each SPD (see «associated fuses» page 17).
Some specific versions, as DACF25/DACF15 series, are equipped with internal protection against short circuit currents and, by this way, can be installed without the need of external devices.

MAINTENANCE

DAC surge protectors are designed for repetitive operation and do not require specific maintenance. Nevertheless, in case of an extreme event, a controlled end of life could occur (see above) and a maintenance operation must be performed.

Pluggable design

The design of most of the CITEL AC power surge protectors is based on the use of a pluggable module that plugs into a matching receptacle. This makes replacement, and checking very easy without impairing the protection function. On multipolar surge protectors, the possibility of replacing a single pole makes rehabilitating a surge protector less expensive. The plug-in module is identified with a color label in relation with the type (Black/Grey = Type 1 ; Red = Type 2 ; Blue = Type 2 low power or Type 3) and are keyed for operating voltage, in order to avoid misapplications.

Signaling

DAC surge protectors are equipped with a mechanical failure indicator linked to the internal thermal disconnector: in case of safety disconnection, the indicator will switch on and the SPD must be replaced.

Remote Signaling

DAC surge protectors are available in «remote signaling» versions. This feature, which allows remote checking of the status of the surge protector, is especially important when the products are hard to reach or unsupervised. The system consists of an auxiliary changeover contact that is activated if the surge protector module changes status. This lets the user monitors :
- the good operation of the SPD
- the presence of the plug-in modules (if any)
- the end of life (disconnection) of the surge protector.

The remote signaling version allows the choice of signaling system appropriate to the installation (light, buzzer, automation, modem transmission...).

VG TECHNOLOGY FOR AC AND PHOTOVOLTAIC SURGE PROTECTORS

Several technologies exist on the market for surge protection of power network:

- **Metal Oxide Varistor (MOV)**
- **Air Gap + Trigger**
- **CITEL VG Technology → MOV + GSG**
  (gas-filled Spark Gap)

VG TECHNOLOGY

This technology is the exclusive and patented technology of CITEL based on the use of specific types of Gas tubes: GSG. These components, the result of over 80 years of experience in the gas discharge tube field, have a behavior adapted to the power network and provide robustness and working stability: their association with varistors combines the advantages of both technologies.
CITEL originally developed the "VG" technology for low voltage Type 1 surge protectors and has then extended it to Type 2 surge protectors and to Photovoltaic applications.

CITEL RANGE USING THE "VG" TECHNOLOGY:

- DAC50VG : Type 2 AC power SPD, Imax = 50 kA
- DAC1-13VG : Type 1 AC power SPD, Iimp = 12.5 kA
- DS250VG : Type 1 AC power SPD, Iimp = 25 kA.
- DUT250VG : 3-phase Type 1 AC power SPD, Iimp =25 kA.
- DS60VGPV : Type 1 PV power SPD, Iimp = 12.5 kA
- DS50VGPV : Type 2 PV power SPD, Imax = 40 kA

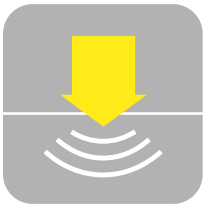
ADVANTAGES OF VG TECHNOLOGY

versus other technologies (specifically the triggered spark gap)

1. Gas-filled-Spark Gap (GSG)

CITEL VG surge protectors are using specific gas discharge tubes: GSG. These essential components are the result of over 80 years of experience in the gas discharge tube field, are meant for power network and ensure a perfect electrical stability.

→ Increase reliability



2. Very low clamping level and high surge current capability

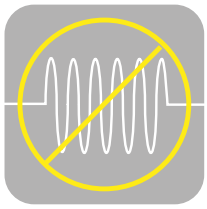
GSG are able to conduct very high surge currents (Iimp, Imax) with a very low residual voltage (Up). Such characteristics could only previously be reached with the combination of a Type 1 and a Type 2 surge protector.

→ Equivalent to Type « 1+2+3 » or « 2+3 » solutions
→ Maximum efficiency
→ Compact design

3. Increased TOV withstand

VG surge protectors can handle very high TOV levels (Temporary over Voltage) up to 450 Vac without any failure or degradation to the level of protection.

→ Increased reliability for areas with unstable power networks.



4. No follow current

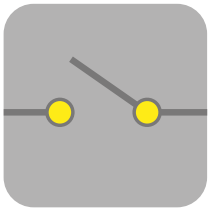
Unlike to "Air Gap" technologies, "VG" Technology does not create any follow on current.
VG solution increases service continuity by no tripping of the upstream overcurrent protection device during surge events.

→ Improvement of the network quality (no power line disturbances)
→ Easy selection

5. Robustness and reliability

All the components of the VG surge protector are designed to handle high impulse discharge currents without any assistance from auxiliary systems. On the contrary, the "Triggered Air Gap" technology includes a control circuit, using very sensitive components, which could be stressed by a part of the surge current and will eventually fail.

→ Increase reliability
→ Better life expectancy



6. Safe disconnection and Device status signalization

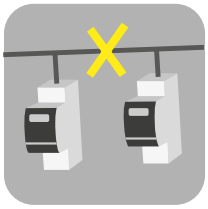
VG surge protectors use a safe disconnection system and provide real-time status indication of internal components. For a "Triggered Air Gap" technology, the disconnection and signalization only can provide the status of the control circuit and not the main protection circuit.

→ Safe and efficient maintenance

7. No ageing

During normal operation, in addition to transient events, varistors are always conducting a small amount of current. This leakage current can be stressful to the varistor over time, especially in DC power systems, and cause the varistor to age prematurely.

→ Maximum life expectancy



8. Easier surge protection coordination

In the case of coordinated SPD installations, the surge protector downstream a VG surge protector does not need any special consideration, such as a sufficient distance between locations, in order to ensure a working coordination between multiple SPDs. Note: due to its optimized protection level, the VG surge protector can be used without any additional surge protector

→ Easier to use

CONCLUSION :

CITEL Surge Protectors based on VG technology offer the best level of efficiency and reliability, conditions essential for achieving the maximum performance of your surge protection system.

DIN RAIL AC POWER SURGE PROTECTORS

SURGE PROTECTION INSTALLATION

Location

CITEL DAC or DS surge protectors are installed as follows, according to their types :

- **Type 1 or «Heavy duty»** : at the origin of the installation, in a separate box or on the main electrical panel, for efficient discharge of partial lightning currents.
- **Type 2 or «Primary»** : at the origin of the installation, on the main electrical panel, in order to eliminate impulses currents as fast as possible and thereby avoid coupling.
- **Type 2 (or Type 3) or «Secondary»** : on the secondary panel, near the sensitive equipment, to limit ringing voltages and improve the level of protection.

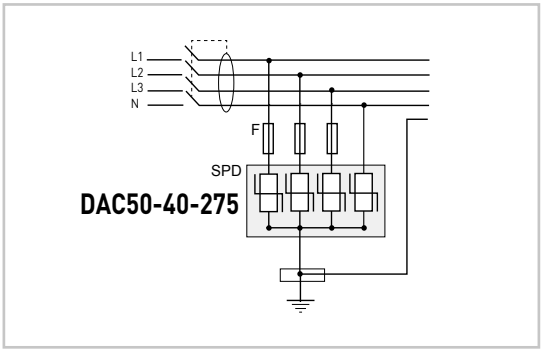
Wiring

Since lightning surges are essentially common-mode phenomena, AC power surge protectors are connected mainly in common mode (between the active conductors and PE).

Some recommendations call for additional differential-mode protection (between phase and neutral). For these applications, CITEL offers specific versions, using L/N protection branches (differential mode) and a specific gas tube branch for the Neutral to PE (common mode) protection: this type of installation is called a «CT2 connection» in IEC 60364 standard, is used in surge protectors such as DAC50-31-275.

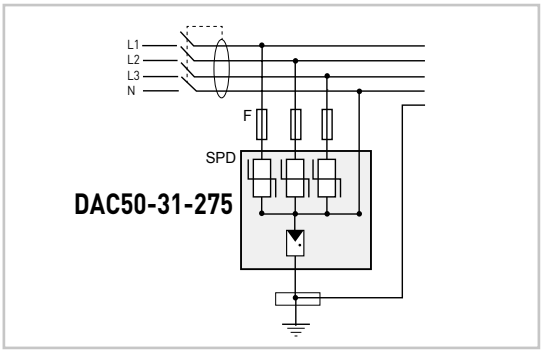
Common mode protection :

CT1 Connection



Common and differential mode protection :

CT2 Connection

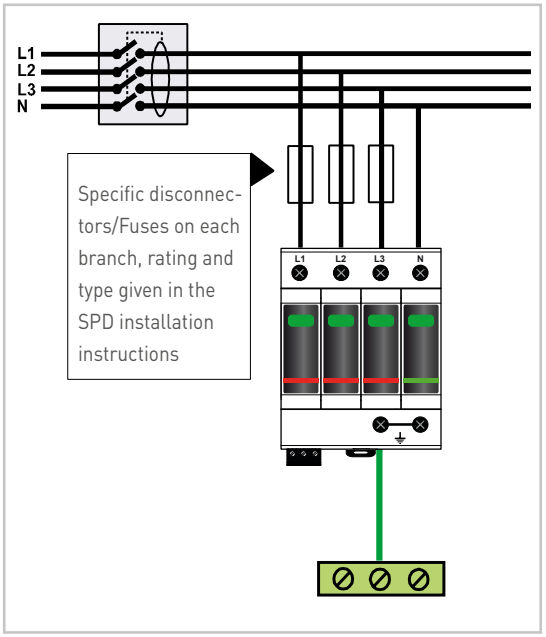


ASSOCIATED FUSES

To comply with standards and safety, the AC surge protectors must be protected against a possible end of life in short-circuit: the user must install on each SPD branch, a protection against short-circuit current (specific disconnectors, standard fuses or breaker).

The type and the rating of these devices are given by the SPD manufacturer in the product datasheet or installation instructions. The choice of this rating depends of 2 criteria:

- Withstand of the short-circuit current test in the IEC 61643-11 standard: the fuse must cut safety the short-circuit current before an harsh destruction of the SPD.
- Withstand of the discharge currents (In or Iimp): the fuse must be able to conduct the discharge current of the SPD without blowing.



SPECIFIC DISCONNECTORS

CITEL has designed a range of specific external disconnectors for SPD (SFD1 range) to replace the regular fuses :

- Optimized and tested in impulse current
- Compacts
- Equipped with strickers to indicate their status and to monitor the remote signal feature of their holders (see page 70).

INTEGRATED DISCONNECTORS

Some specific versions, as DACF25/DACF15 series, are equipped with internal disconnector against short circuit currents, in addition of the internal thermal disconnectors, and, by this way, can be installed without the need of external devices. These SPDs are classified as "SPDI".

CITEL

Installation

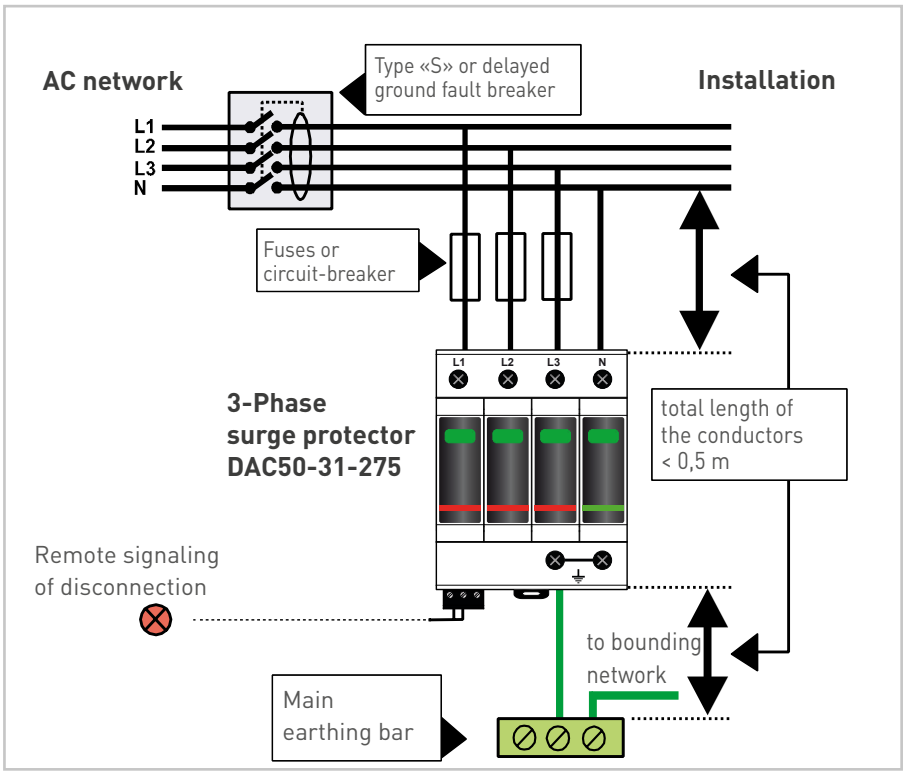
DAC surge protectors are connected in parallel on the AC network and must be equipped with external fuses for short-circuit current protection (see paragraph «Associated fuses»).

- The total length of parallel connection wires to AC network must be lower than 0.5 m in order not to increase the protection level (Up) provided by the SPD.
- Wiring is made by screw connections. On some models, a distribution bus can be used.
- The protection wire coming from the SPD must be connected to the bonding bar of the electrical panel. Paralleling the protection wire with phases conductors must be avoided.
- The cross sectional wire must be 6 mm² minimum for Type 2 SPD and 16 mm² for Type 1.
- Local earthing resistance must be in compliance with the electrical rules.

Further information can be found in IEC 61643-12 standard (selection and application principles for low voltage SPD).

Installation example

Type 2 surge protector DAC50S-31-275



DIN RAIL AC POWER SURGE PROTECTORS

CHOOSING SURGE PROTECTORS

CITEL's line of AC power surge protectors is designed to cover all possible configurations in AC low voltage installations.
They are available in many versions, which differ in :

- Type (1 , 2 or 3) or Test Class (I , II or III)
- Operating voltage (Uc)
- AC network configuration (Single/3-Phase)
- Discharge currents (Iimp, Imax, In)
- Protection level (Up)
- Protection technology (varistors, VG technology, filter)
- Features (differential mode, plug-in, remote signaling, compact, integrated fuse..).

The surge protection selection must be done following the local electrical code requirements (e.g. : minimum rating for In) and specific conditions (e.g. : high lightning density).

Choosing the Type of surge protectors

The type of surge protector is based on its location and the constraints of the installation to be protected.

Configuration	SPD	Location	CITEL
Installation equipped with LPS or could be hit by lightning	Type 1+2 Type 1+2+3	Origin of the installation origin (Panel or main switchboard)	DAC1-13 DAC1-13VG DS250VG DUT250VG DS250E DS500E
Installation without LPS	Type 2 Type 2+3	Main switchboard	DAC80, DAC50 DAC50VG DAC40C DACF25
Secondary protection (downstream primary SPD)	Type 2 (or Type 3)	Close to protected equipment	DAC15C DACF15 DACN10

Choosing the operating voltages Uc and U_T

The SPD Uc voltage (maximum continuous operating voltage) depends on:

- Nominal voltage of the AC network (Uo)
- Type of AC system (TN, TT, IT).

The level of withstand to temporary overvoltages (UT) is related to the Uc voltage. In addition, withstanding the "high voltage" TOV (1200 Vac, 300 A, 200 ms) between Neutral and PE is needed in TT AC system, which requires the CT2 diagram.

Operating voltage Uc (Line/Earth)

AC Network	230/400V		
AC system	TT	TN	IT
Uc Voltage mini	255 V	255 V	440 V
U_T Voltage	335/440V	335/440V	-
TOV N/PE	1200 V	-	-
Example of CITEL products	DAC50-11-275	DAC50-20-275 DAC50-11-275	DAC50-30-440

Choosing the AC network configuration

DAC and DS surge protectors are available for single, 3-Phase and 3-Phase + neutral AC networks.

Choosing Iimp

The impulse current Iimp is defined for Type 1 SPD. The minimum rating for Iimp is 12.5 kA by pole, following IEC 60364-5-534 . This level is adapted to the real phenomenon. This value can, however, be increased according to the risk (calculation according to IEC 62305-1)
CITEL proposes, in its Type 1 SPD range, 3 levels of Iimp current by pole: 12.5, 25 and 50 kA.

Configuration	Iimp/pole	CITEL
Maximum risk	50 kA	DS500E
Very high lightning density	25 kA	DS250VG, DS250E DUT250VG
High, medium or low lightning density	12.5 kA	DAC1-13, DAC1-13VG

Choosing In

The minimum rating of In for a SPD connected at the installation entrance is 5 kA (8/20 µs waveform), required by standard.
Nevertheless higher ratings are advised in case of high lightning density. Moreover higher values of In current will increase the SPD lifetime.
Imax (maximum discharge current) rating is linked to In.

Conditions	In	CITEL
Very high lightning density	> 20 kA	DAC80
High or medium lightning density	10-20 kA	DAC50 DAC50VG DAC40C, DACF25
Low lightning density or secondary SPD	≤ 5 kA	DAC15C, DACF15,DACN10

Choosing the protection level Up

The user must select a surge protector with a protection level Up adapted to the withstand level of terminal equipment. In every case, the lower the protection level Up, the better the protection. IEC 60364 standard calls for the minimum protection level of 2.5 kV for a SPD connected at the entrance of a 230/400 V network: this level is in compliance with the withstand of robust devices (electromechanical type).
Electronic-based terminals have lower impulse withstand and require a better protection: so, surge protectors with 1.5 kV protection are necessary to provide efficient protection.

Conditions	Recommended Up	
	230/400 V AC network	120/208 V AC network
SPD at the installation entrance	2.5 kV max.	1.5 kV max.
Electromechanical protected equipment	2.5 kV	1.5 kV
Electronic-based protected equipment	1.5 kV	0.8 kV

Choosing the SPD technology

A relevant choice of the SPD technology, as well as the use of coordination diagram can help to improve the protection level.

DAC and DS surge protectors are based on Varistor (MOV) technology.
Some versions use different electrical diagrams in order to improve some of their characteristics :

➡ **«VG» technology** :
This GSG-MOV hybrid association, used in SPD: DAC1-13VG, DS250VG, DUT250VG, DAC50VG, improves the reliability and the efficiency (see page 15-16)..

➡ **Association with RFI filter** :
The Surge protection panel M series and secondary SPDs DS40HF and DS-HF combine surge protection stage and/or filter stage in order to improve the protection level.

Coordination of Surge Protectors

In order to provide maximum protection efficiency, it is necessary to create a «coordination» diagram, that means installation of a «primary» SPD at the network entrance and a «secondary» close to sensitive equipment.

This association is required in the 2 following cases :

- **Long length** (greater than 10 m) of wire between equipment to be protected and primary SPD : Coordinated SPDs will reduce the ringing voltages created during the surge transmission.

- High sensitivity equipment : Coordinated SPDs will improve of protection level.

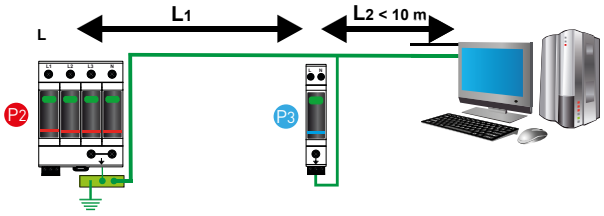
Efficient SPD coordination is performed by including between primary and secondary SPDs :
- a minimum length of wire (> 10 m)

or
- a coordination inductor (DSH range).

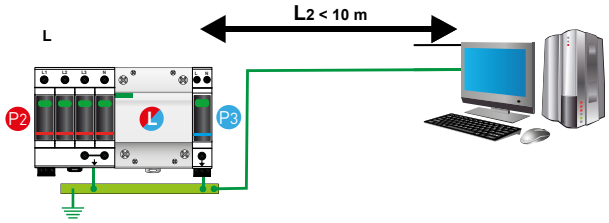
Coordination with VG Surge Protector

With VG technology, there is no consideration of the cable length or to use inductance (see page 21) : a secondary SPD can be connect directly downstream the primary one.

Coordination by conductor



Coordination by inductor



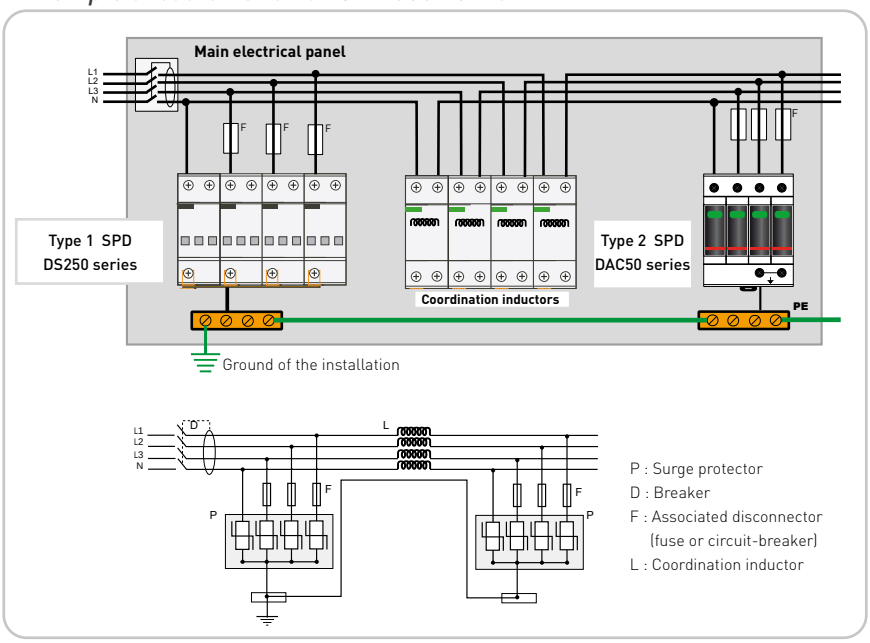
P2 : Primary surge protector (ex. DAC50)
P3 : Seconadary surge protector (ex. DAC15C)
L : Coordination inductors (ex. DSH35)
L1 : Length of conductor between surge protector
L2 : Length of conductor between surge protector and installation

DAC AND DS SURGE PROTECTORS WIRING

COORDINATION OF SURGE PROTECTORS

In order to provide maximum protection efficiency, it is necessary to create a «coordination» diagram: that means installation of a «primary» SPD at the network entrance and a «secondary» close to sensitive equipment.
Efficient SPD coordination is performed by including, between primary and secondary SPDs:
- a minimum length of wire (> 10 m).
or
- coordination inductors (DSH range: see below).
Futher information is available in installation instruction sheet.

Example of coordination on 3-Phase network

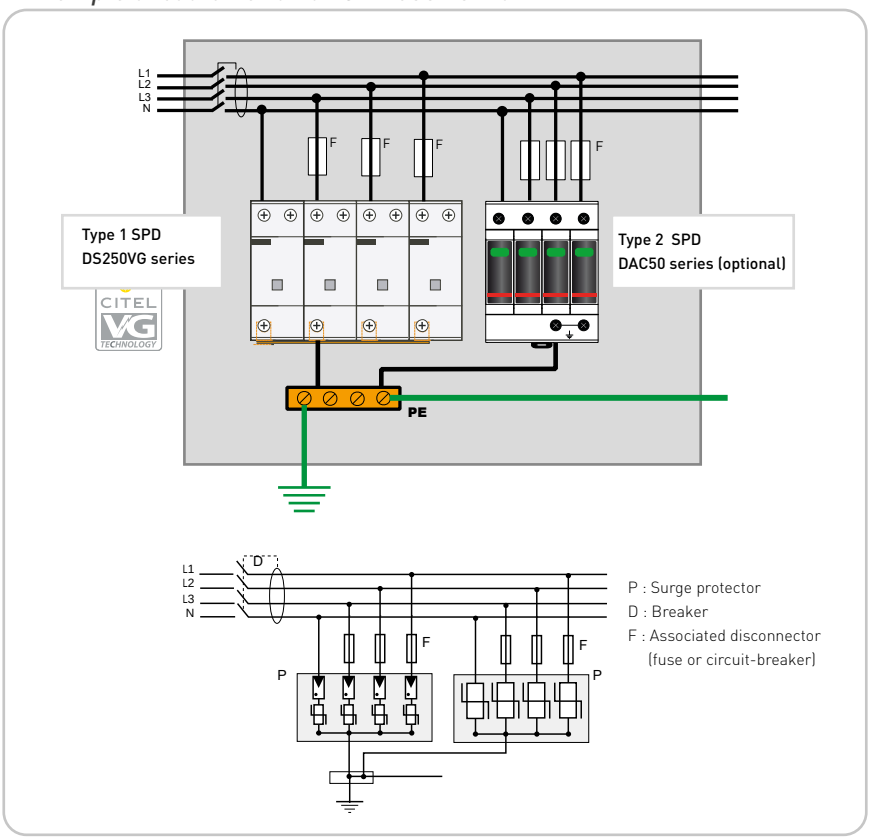


DIRECT COORDINATION WITH VG SURGE PROTECTOR

An additional benefit of the VG technology is to ensure effective coordination with secondary surge arrester without special precautions (no decoupling length required). It is therefore possible to directly connect the output of the surge arrester head VG secondary.

Note: However, because of the very high lightning discharge capacity and low residual clamping of the VG SPD, the addition of a secondary surge protector is not necessary.

Example of coordination on 3-Phase network



CITEL

COMMON MODE PROTECTION (CT1CONNECTION)

Common mode (L/PE or N/PE) protection provided by DAC/DS surge protectors in relation with the different types of AC network. Called CT1 connection type in IEC 60364 std.

INTERNATIONAL STANDARDS FOR AC SURGE PROTECTORS

The performance, selection and application of AC surge protectors are defined by standards, to ensure an efficient and secure use.
National standards are based on IEC international standards. In the field of AC surge protection, several documents must be taken into consideration.

STANDARDS IN AC SURGE PROTECTION

Related standards for test performance, selection and application of low voltage SPDs are :

General rules : IEC 60364 standard

- **Section 4-443** : «Protection against overvoltages of atmospheric origin or due to switching» :
This section of IEC 60364 is intended to describe the means by which transient overvoltages can be limited and describes the configurations where the surge protection is necessary.

- Section 5-534 : «Devices for protection against overvoltages» :
This section gives the basic requirements for the selection and implementation of the SPDs for electrical installation of buildings to obtain a limitation of transient overvoltages.

Product test standard : IEC 61643-11 :

This document addresses performance tests for AC surge protective devices (SPDs) following different classes (Class I , II or III tests). It is mainly dedicated to surge protector manufacturers.

Selection and application guide : IEC 61643-12 :

This guide addresses in details the selection and application principles of SPDs in practical situations.

RECOMMENDATIONS FOR SPD INSTALLATION

Section 4-443 of IEC 60364 recommends SPD application depending of the type of installation :
Protection against transient overvoltage shall be provided where the consequence caused by overvoltage affects:

a) human life, e.g. safety services, medical care facilities;
b) public services and cultural heritage, e.g. loss of public services, IT centres, museums;
c) commercial or industrial activity, e.g. hotels, banks, industries, commercial markets, farms.

For all other cases (dwellings, small apartment buildings), a risk assessment (based on Lightning density, Length of external low voltage lines and Environment factor) shall be performed in order to determine if protection against transient overvoltage is required.

SELECTION OF THE SPD

Section 5-534, among other, gives the minimum performance required for SPD installed at the entrance of installation :
1 - The installation equipped with lightning rod (LPS):
➪ Recommendation : Type 1 SPD, with Lightning impulse current Iimp of 12.5 kA minimum, connected at the origin of the installation.

2 - The installation is connected to an AC network, without LPS :
➪ Recommendation : Type 2 SPD, with nominal discharge current In ⩾ 5 kA, connected at the origin of the installation.

Application of the AC surge protectors following IEC 60364-4-443

Consequences caused by overvoltage, or Type of installations	SPD application
Loss of human life, e.g. safety services, medical care facilities;	Mandatory
Loss of public services and cultural heritage, e.g. loss of public services, IT centres, museums;	Mandatory
Loss of commercial or industrial activity, e.g. hotels, banks, industries, commercial markets, farms.	Mandatory
Dwellings or apartment buildings	Risk analysis required

CONCLUSION

Following international rules, AC surge protectors are required for most of the installations.
Risk assessment methods are also available to determine more accurately the need of surge protection.

NORTH-AMERICAN REGULATION ON LOW VOLTAGE SURGE PROTECTION DEVICES

STANDARD STATUS

In North America, the IEC international standard does not apply. Other national standards and guidelines exist, such as UL, NEC and ANSI/IEEE, which are used to determine your risk to transients in low voltage power networks as well as the use of appropriate protector for each application.

NEC (National Electrical Code):

The article 285 of NEC defines the use of standalone surge protectors and imposes their compliance with the product standard UL1449 Ed. 5.
The article 285 defines the selection and installation conditions of SPDs.

Product Standard: UL1449, 5th Ed.:

This document, devoted to surge protection manufacturers, defines the parameters as well as the test procedure to qualify an SPD: it is important to note that the UL Type designations of surge protective devices, while similar, is not exactly the same as SPD types in IEC61643-11.

SPD type according to UL 1449 5th Ed.:

Type 1 - Permanently connected surge protection devices to be installed both, on the supply side and the load side of the equipment main overcurrent protective device. The surge protection devices are supposed to be self-protected against short circuits and do not require external protection.
Type 2 - Permanently connected surge protection devices to be installed on the load side of the main equipment overcurrent protective device. This surge protection device requires an external short circuit protection device.
Type 3 - Surge protection devices installed at a conductor length of 10 meters or greater from the electrical panel. For example, the mobile surge protectors (that can be plugged into the outlet such as a multiple power outlet etc.). They can also be directly installed on the equipment to be protected.
Type 4 « Component Assemblies » - Component Assemblies consisting of one or more Type 5 components and a disconnect complying with the limited end-of-life short circuit current tests (0.5A, 2.5A, 5A and 10A).
Type 1, 2, 3 « Component Assemblies » - Type 4 Component Assemblies having, in addition to the limited end-of-life short circuit current tests, passed all the other end-of-life tests (under the short circuit current of 100A, 500A, 1000A and SCCR) and also with (2CA) or without (1CA) external short circuit protection
Type 5 - Discrete component surge suppressors, such as MOVs, Diode or GDT that may be mounted on a PCB, connected by its leads or provided within an enclosure with mounting means and wiring terminations.

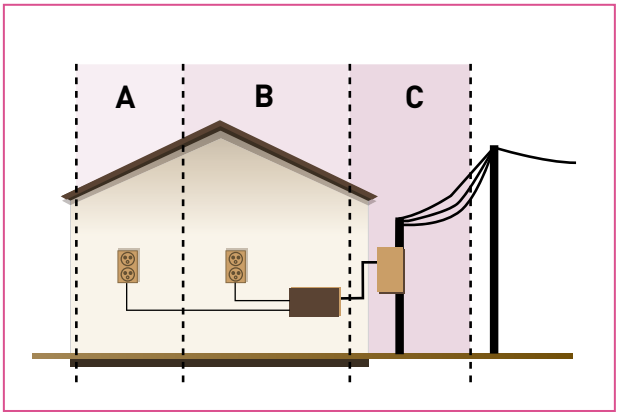
ANSI/IEEE Guide:

ANSI/IEEE publishes different informative guides regarding the risk of transient overvoltages to low voltage networks (IEEE C62.41.1), the surge environment and types of transients (IEEE C62.41.2) as well as the method for testing equipment against transients that are connected to the low voltage network (IEEE C62.45). Another important guideline detailing the installation of SPDs is IEEE C62.72.

IEEE C62.41.2 Guide

IEEE C62.41.2 Guide provides the selection of performance surge arresters according to their location in the system.

Categories depending on the location following IEEE C62.41.2 Guide



Selection of surge protector following IEEE C62.41.2 Guide

Catégories of location		Minimum withstand of recommended arresters	
		Voltage 1,2/50 µs	Current 8/20 µs
A	Indoor installation	6 kV	0.5 kA
B	Entry installation	6 kV	3 kA
C	Outdoor installation, low exposure	6 kV	6 kA
C	Outdoor installation, high exposure	10 kV	10 kA

PLUGGABLE DAC RANGE FROM CITEL

A PLUGGABLE DESIGN

The design of DAC surge protectors is based on the use of **a module to be plugged** into a matching base. This makes **replacement and checking very easy** without impairing your protection.
For multipole surge protectors, the possibility of **replacing a single pole makes repairing a surge protector less expensive**.
The plug-in module is identified with a color label in relation with the type (grey = Type 1 ; red = Type 2 ; blue = low power Type 2 or Type 3) and are keyed for operating voltage, in order **to avoid misapplications**.

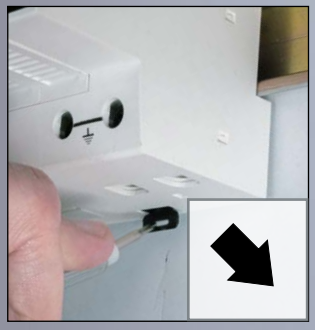
Application field

Application in standard electrical cabinets in compliance with international standard.

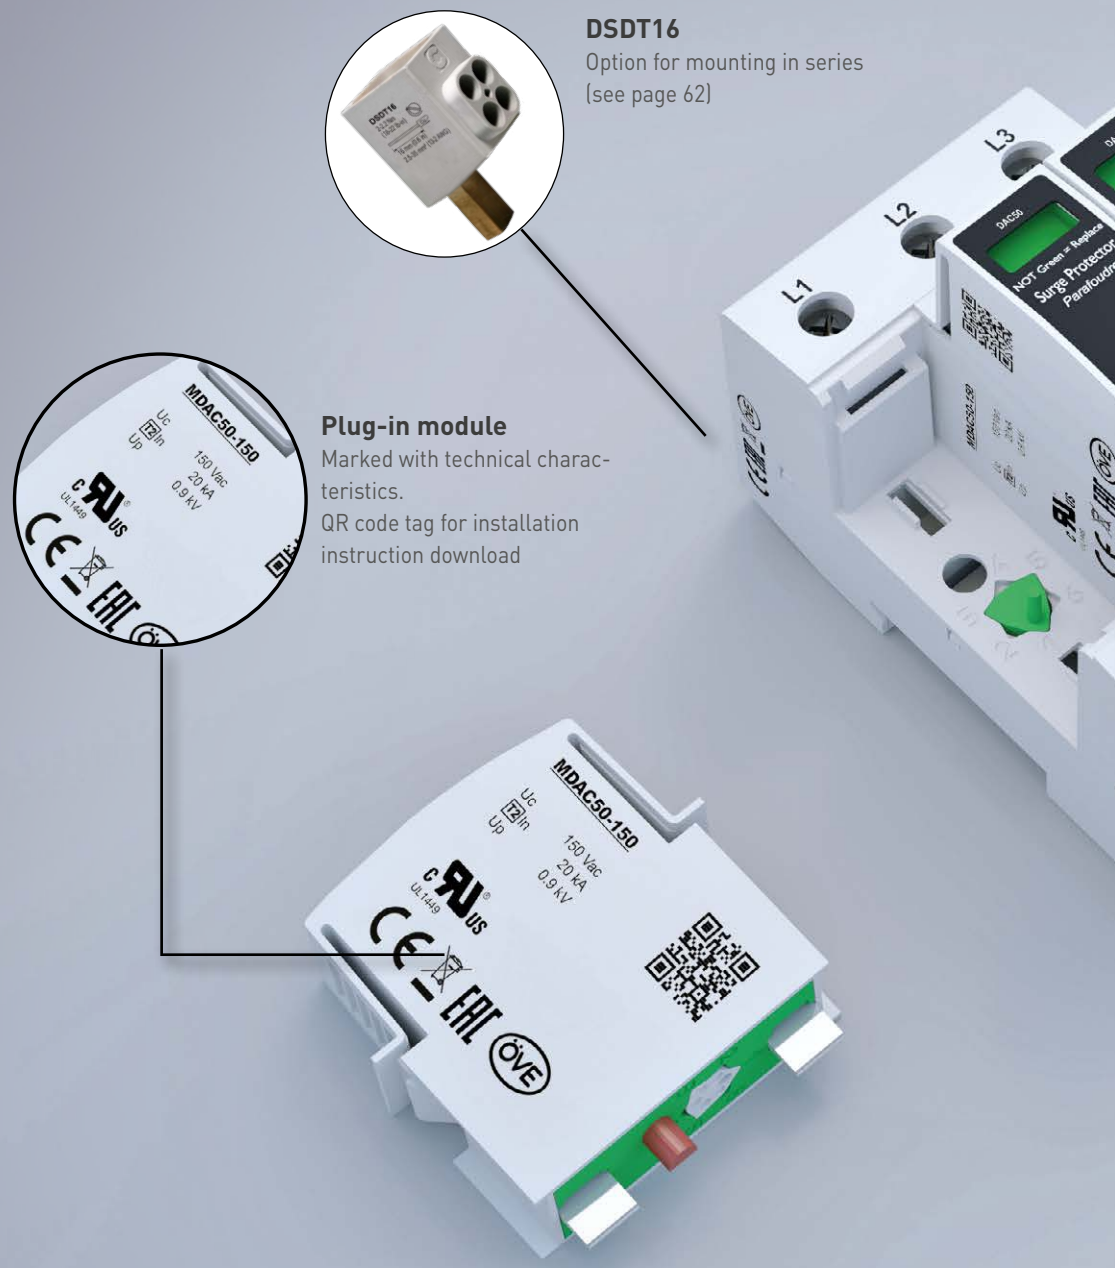
DIN Rail mounting

Slide the surge protector into the rail, and press until the unit fits and snaps.

Uninstall



Pull the assembly clamp, and remove the device.



DSDT16
Option for mounting in series
(see page 62)

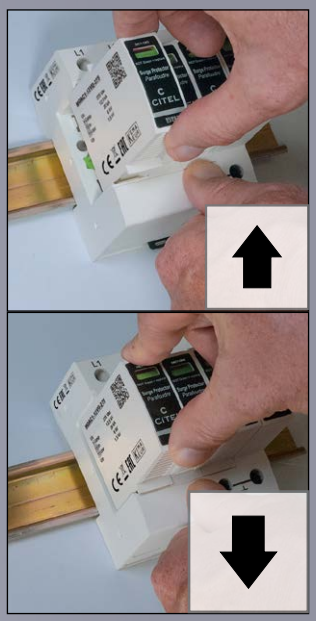
Plug-in module
Marked with technical characteristics.
QR code tag for installation instruction download

Identified connections
All connections are identified to avoid wiring mistakes.

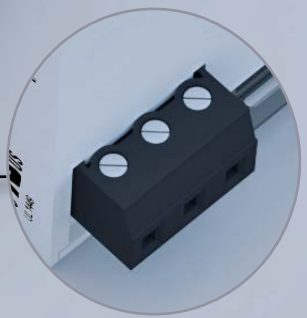
Signaling

Defective modules are identified by red indicator in the front window. It is then necessary to replace them

Spare module

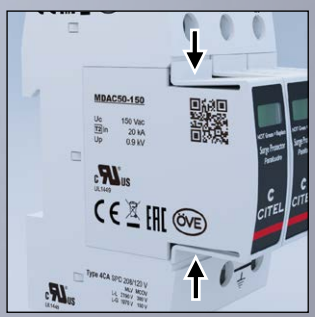


Easy module replacement, requiring no tools, thanks to the pluggable feature.



Remote signaling
Less wiring thanks to a single remote signaling connector for all poles.

Locking feature
On some versions, the pluggable module is locked in position through dedicated clips.



Module keying

Mistake-free replacement thanks to an explicit and mechanical codification for the different operating voltages.

TYPE 1+2 AND TYPE 1+2+3 SURGE PROTECTORS

Type 1+2 and Type 1+2+3 surge protectors are heavy duty devices, designed to be installed at the origin of the AC installations equipped with LPS (Lightning Protection System). They are necessary to protect sensitive equipment connected to AC network against indirect effects of lightning, and even in case of direct strike. Following the different national electrical codes, these SPDs can be recommended or mandatory, especially in case of LPS on the building . These surge protectors are tested following Class I tests from IEC 61643-11, characterized by 10/350 µs lightning current injections.

These surge protectors are available in a wide range of versions to be adaptable to all configurations :

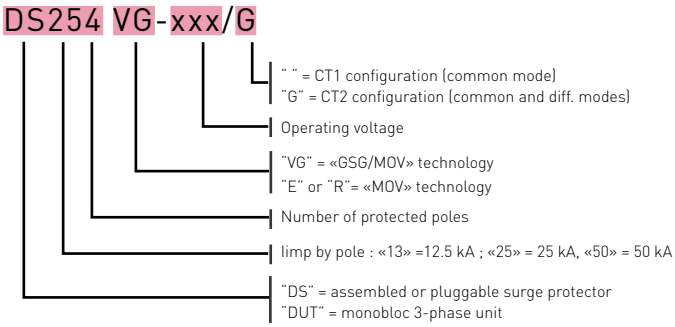
- Iimp by pole : 12.5, 25 and 50 kA
- Total Iimp : up to 100 kA
- Single, 3 or 3-Phase+Neutral AC network
- 230/400 V, 120/208 V and 690 V AC network
- All AC system types
- Common mode protection (CT1 configuration) or Common and Differential mode protection (CT2 configuration)

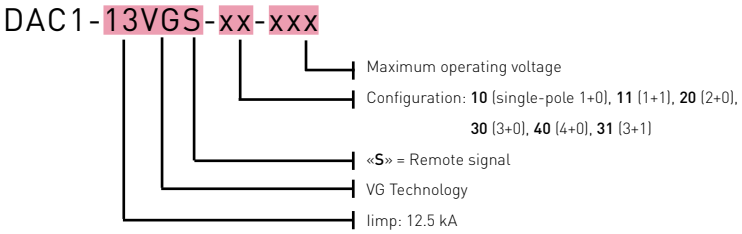
Several mechanical formats are available to meet the needs of the user: assembled unipolar units, monobloc device or multipole equipped with pluggable modules.

These multipolar SPDs are using 2 different technologies:

- DS250VG, DAC1-13VGS, DUT250VG: «VG» technology,
- DS500E, DS250E, DAC1-13S: «MultiMOV» technology.

PART NUMBER INFORMATION





Range		Description	limp by pole (10/350 µs)	Characteristics	Page

Characteristics

CITEL model		DACN1-25VGS-10-760
Description		Type 1+2+3 AC surge protector - 1-pole
Max. AC operating voltage	Uc	760 Vac
Temporary Over Voltage (TOV) characteristics - 5 sec	UT	1000 Vac
Temporary Over Voltage (TOV) characteristics - 20 mn	UT	1325 Vac
Residuel current *- Leakage current at Uc*	Ipe	none
Max. Load current *(if connection serie)*	IL	100 A
Follow current	If	none
Nominal discharge current *15 x 8/20µs impulses*	In	35 kA
Maximal discharge current *max. withstand @ 8/20 µs*	Imax	70 kA
Impulse current by pole *max. withstand @ 10/350 µs by pole*	Iimp	25 kA
Specific energy by pole	W/R	156 kJ/ohm
Withstand on combination waveform *Class III test*	Uoc	6 kV
Protection level *@ In (8/20µs) et 6 kV (1.2/50µs)*	Up	2.5 kV
Residual voltage *@ 25kA (8/20µs)*	Up-25kA	2.1 kV
Residual voltage *@ 5kA (8/20µs)*	Up-5kA	1.6 kV
Admissible short-circuit current	Isccr	50 000 A
Associated disconnectors		
Thermal disconnector		internal
Fuses		Fuse type gG - 315 A
Existing upstream ground breaker (if any)		Type «S» or delayed
Mechanical characteristics		
Dimensions		see diagram, 2 TE (DIN43880)
Connection to network		by screw terminals : 2.5-25 mm² (35mm² rigid)
Disconnection indicator		1 mechanical indicator Green/Red
Remote signaling of disconnection		output on changeover contact
Failsafe mode		Disconnection from AC network
Max. voltage/current for remote signaling		250 V/0.5 A (AC), 30 V/3 A (DC)
Wiring for remote signaling		1.5 mm² max.
Mounting		Symmetrical rail 35 mm² (EN60715)
Operating temperature		-40/+85°C
Protection rating		IP20
Housing material		Thermoplastic UL94 V-0
Standards		
Compliance		IEC 61643-11 / EN 61643-11 / UL1449 ed.5 / GB/T 18802.1
Certification		TUV Rheinland

TYPE 2 AND TYPE 3 SURGE PROTECTORS

Type 2 (or Type 2+3) Surge Protectors are designed to be installed at the origin of the electrical installation or close to sensitive equipment to protect against transient voltages coupled into the Low Voltage network, if no LPS is used.
Regarding international standard, Type 2 AC Surge Protectors are required for most of the installations, linked with the consequences of possible losses due to the surge voltages. These Surge Protectors are testing following Class II tests from IEC 61643-11 , with 8/20 µs discharge currents.

Type 3 surge protectors are low power SPDs, intended to be installed near sensitive equipment, in coordination with Type 2 SPD installed upstream. Type 3 SPDs are especially required if the sensitive devices to protect are located father than 10 m away from the Type 2 SPD.

CITEL Type 2 and Type 3 surge protectors are available in a wide range of versions to be adaptable to all configurations :

- Imax by pole : from 5 to 70 kA
- Single, 3 or 3-Phase+Neutral AC network
- Compact versions
- 230/400V or 120/208V AC networks
- All AC system types
- Remote signaling
- Integrated fuse option : SPDI (DACF25S / DACF15S)
- Common mode protection (CT1 configuration) or Common and Differential mode protection (CT2 configuration)

CITEL Type 2 and Type 3 surge protectors are offered mainly in pluggable version. Monobloc solutions are also available.

CITEL Type 2 are based on the use of varistors.
Type 2+3 «High efficiency» versions are based on VG technology (DAC50VGS)

STANDARD SURGE PROTECTORS

Range		Description	Imax/ pole	Characteristics	Page
DAC80S		Reinforced Type 2 SPD	80 kA	Type 2 High energy pluggable	49
DAC50VGS		Type 2+3 SPD VG Technology	50 kA	Type 2 + 3 Very high efficiency pluggable	51
DAC50S		Type 2 SPD	50 kA	Type 2 pluggable	53
DACF25S		Type 2 SPD + integrated fuse	25 kA	Type 2 Integrated fuse pluggable	55
DACF15S		Type 2 (or 3) SPD+ integrated fuse	15 KA	Type 2 (or 3) Integrated fuse pluggable	59

COMPACT SURGE PROTECTORS

Range		Description	Imax /pole	Characteristics	Page
DAC40CS **DAC15CS**		Single phase SPD	40 kA 15 kA	Single phase Compact Pluggable	57 61
DAC40CS **DAC15CS**		3-phase+N SPD	40 kA 15 kA	3-phase Compact Pluggable	58 62
DACN10S		Single phase SPD	10 kA	Single phase Compact Monobloc	63
DS40HFS **DS-HF**		SPD + RFI filter	40 kA 10 kA	SPD with RFI filter stage	65 66

Imax 80 kA

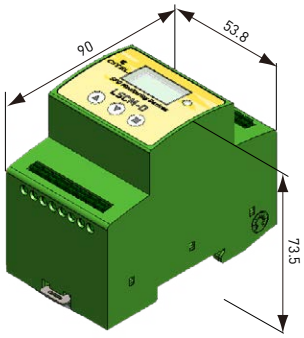
LSCM-D		Surge Counter & SPD Monitoring	68
DSH		Coordination Inductors	69
SFD		Specific Fuses	70
DSDT16		Screw terminal connection	71

LSCM-D RANGE

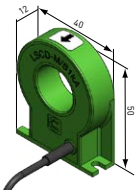
Complete unit LSCM-D/24/P1000

- **Lightning and Surge Current Counter & SPD monitoring device**
- **Wide surge current detection range :**
  - **0.3/25 kA or 1/50 kA @ 10/350µs**
  - **0.3/50 kA or 1/100 kA @ 8/20µs**
- **Front display for access to recorded events and device parameters**
- **Peak current and time stamping recording of the surge currents**
- **RS485 communication interface / MODBUS protocol**
- **Monitoring features : 2 inputs (SPD or disconnector status)/1 ouput**
- **IEC62561-6 compliance**

Characteristics



Monitoring unit LSCM-D/24



Sensor LSCM-P1000

CITEL Range	LSCM		
Application	Detect and record surge & lightning currents and monitor the SPD status		
Range of lightning current detection	P1000 version: 1-100 kA (8/20µs), 1-50 kA (10/350µs) P300 version: 0.3-50 kA (8/20µs), 0.3-25 kA (10/350µs)		
Input/output	Two channels of input switching signal and one channel of output switching signal		
Communication	RS485 bus (MODBUS protocol)		
Power supply	24 Vdc/ 24 Vac (LSCM-D/24) or 120/230 Vac (LSCM-D/230AC)		
Built-in battery (date saving) life	3-6 months, rechargeable		
Error and pricision (peak value)	0.1 kA ; +/- 5%		
Display module	128*64 lattice OLED display, green/red status LED display		
CITEL model	**LSCM-D/****	**LSCM-P1000**	**LSCM-P300**
Description	Monitoring unit	1 kA sensor	0.3 kA sensor
Dimensions	See diagram	See diagram	see diagram
Weight	130 g	40 g (with 1m wire)	40 g (with 1m wire)
Mounting	Symmetrical DIN rail 35 mm (EN60715)	2*M3 bolts	2*M3 bolts
Operating temperature	-25/+70°C	-25/70°C	-25/+70°C
Storage temperature	-20/+60°C	-20/+60°C	-20/+60°C
Protection rating	IP20	IP20	IP20
Housing material	Thermoplastic UL94 V-0	Thermoplastic UL94 V-0	Thermoplastic UL94 V-0

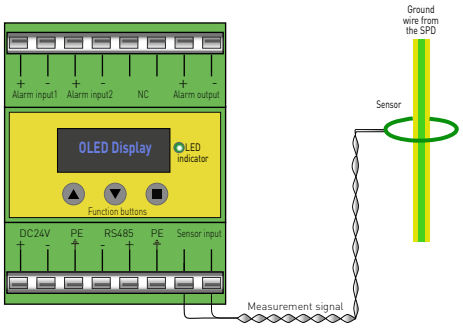
LSCM-D/24/P300	Complete set - 24V power - 0.3 kA mini detection		793531
LSCM-D/230AC/P1000	Complete set - 230Vac power - 1 kA mini detection		793534
LSCM-D/230AC/P300	Complete set - 230Vac power - 0.3 kA mini detection		793533

***) 24 or 230AC*

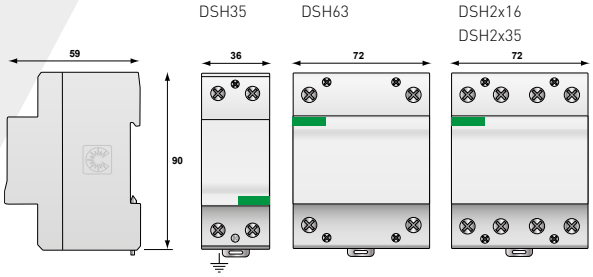


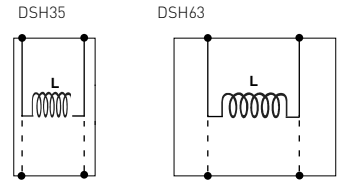
Application

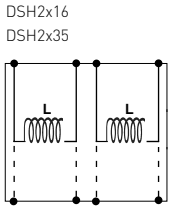
DSH 35

DSH SERIES

- **Coordination inductors for Surge Protectors**
- **For use with the DS series**
- **35 A and 63 A versions**
- **2x16 A and 2x35 A double inductor versions**
- **See «coordination» pages 20-21**







L : inductor

Characteristics

CITEL model		DSH63	DSH35	DSH2x35	DSH2x16
Description		Coordination inductor			
Max. operating voltage	Uc	500 Vac	500 Vac	500 Vac	500 Vac
Max. line current	IL	63 A	35 A	2 x 35 A	2 x 16 A
Line inductance		15 µH	15 µH	2 x 15 µH	2 x 15 µH
Mechanical characteristics					
Wiring		1 DSH in serie on each active wire		1 DSH in series on 2 active wires	
Dimensions		see diagram			
Connection		screw terminals : 6-35 mm²			
Mounting		Symmetrical DIN rail 35 mm (EN60715)			
Operating temperature		-40/+85°C			
Protection class		IP20			
Housing material		Thermoplastic UL94 V-0			
Part number					
		360807	360806	360808	2690

SFD1-25 SFD1-13

SFD SERIES

- **Specific Fuses (SPD Fusing Disconnectors) for short circuit protection of Type 1 AC surge protectors**
- **Surge current withstand: 12.5 or 25 kA @ 10/350µs**
- **Very compact**
- **Fusion signaling feature**
- **Remote signaling through fuse holder**

The SFD range has been especially designed to associated with Type 1 SPDs. These very specific fuses are able to conduct huge surge currents in rather small dimensions to protect Type 1 SPDs against harsh short circuit failures.

In order to comply IEC61643-11 standard, AC power SPD must be protected against short circuit failures : these specific fusing disconnectors must be installed in the SPD branches.
The SFD are equipped with fusing indicator to be used inside dedicated holder with remote signalling feature.

the SFD disconnectors must be used with specific fuse holders which provide :

- Relevant surge current capability
- Remote signaling feature
- Switching (useful for maintenance purpose)

Characteristics

CITEL Model		SFD1-25	SFD1-13
Description		Fusing disconnector for Type 1 AC surge protector	
Maximum AC operating voltage	Uc	500 Vac	500 Vac
Maximal discharge current *1 x 8/20 µs impulse*	Imax	100 kA	80 kA
Nominal discharge current *15 x 8/20 µs impulses*	In	80 kA	50 kA
Maximum discharge current *max. withstand 10/350µs by pole*	Iimp	25 kA	12.5 kA
Equivalent rated AC current		250 A	125 A
Residual voltage *@ Iimp*	Up	< 0.5 kV	< 0.4 kV
Breaking capacity		100 000 A	100 000 A
Safety			
Fusing indicator		yes	
Remote fusing indication		through dedicated fuse holder	
Mechanical characteristics			
Format		Cylindrical	Cylindrical
Dimensions		22x58 mm	14x51 mm
Mounting		on cylindrical fuse holder	
Operating temperature		-40/+85°C	
Protection rating		IP20	
Standards			
Compliance		EN 61643-11 / IEC 61643-11 EN 60269-1/EN 60269-2/IEC60269-1/IEC60269-2	
Part number			
		39489	39466

SFD1-25S-31

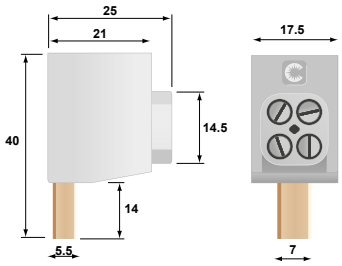
SFD1-13S-11

ASSEMBLY OF FUSES SFD1-13 (14x51) + HOLDERS		
SFD1-13S-11*	64047	Assembly for single phase (L+N) + remote signal
SFD1-13S-20**	64051	Assembly for single phase (L+N) + remote signal
SFD1-13S-30	64052	Assembly for 3-phase + remote signal
SFD1-13S-31*	64048	Assembly for 3-phase+N + remote signal
SFD1-13S-40**	64053	Assembly for 3-phase+N + remote signal
ASSEMBLY OF FUSES SFD1-25 (22x58) + HOLDERS		
SFD1-25S-11*	64049	Assembly for single phase (L+N) + remote signal
SFD1-25S-20**	64055	Assembly for single phase (L+N) + remote signal
SFD1-25S-30	64056	Assembly for 3-phase + remote signal
SFD1-25S-31*	64058	Assembly for 3-phase+N + remote signal
SFD1-25S-40**	64057	Assembly for 3-phase+N + remote signal

** the Neutral position is equipped with a non-fusing element, for TT and TN system application*
** the Neutral position is equipped with a fusing element, for IT system application*

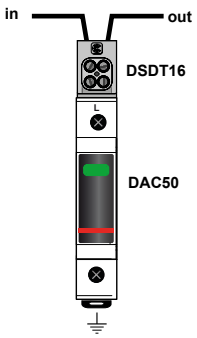
DSDT16

- «V» connection screw terminal for SPD
- Improved connection for better efficiency
- 2 x 35 mm² wire connection



Characteristics

CITEL model	DSDT16
Description	Screw terminal for «V» connection
Mini-max. cross section	2.5 - 35 mm² (13-2 AWG)
Torque	2-2,2 Nm (18-22 lb-in)
Max Load Current (IL)	100 A
Insulation material	Polycarbonate UL94 V-0
Metal part	Brass
Mounting	on DAC/DS range terminal
Part number	400102



CITEL

DC POWER SURGE PROTECTORS

DC POWER SURGE PROTECTORS

DC power networks are used in more and more applications and the threat of disturbances due to surge voltages must be taking in to account like for AC power lines.

The most common applications using DC power:

- 48 Vdc for Telecom installations
- 24 to 130 Vdc for off-grid PV sites
- 380/400 Vdc for Datacenters/Telecom centers
- 400 to 1000 Vdc for Electrical Vehicle Charging Stations
- 750 to 1500 Vdc for Railways electrification systems
- 800 to 1500 Vdc for Energy Storage Systems (ESS)

All these installations are critical and their possible disturbances or losses of operations are not acceptable: relevant surge protection will improve their proper operation and life duration.

CITEL has designed a wide range of surge protectors for all the DC power networks.
These surge protectors are available in a wide range of versions to be adaptable to all configurations :

- Type 1 or Type 2 Surge protectors
- DC voltage from 12 to 1500 Vdc
- Pluggable versions
- 1-pole or 2-pole configuration
- «Y» diagram for high voltage application
- Safety disconnectors and remote signaling feature

Selection of DC power Surge protectors

Depending of the type of DC power network, the choice of the relevant SPD must follow these processes

DC power line	Criteria	SPD Selection
Lightning stress	Direct or Indirect	Type 1 or Type 2
Maximum DC voltage	12 to 1200 Vdc	Uc parameter
Topology of the line	1-wire or 2-wire	1-pole or 2-pole configuration
Short circuit current	up to 100 kA	Isccr parameter

A particular attention must be paid to the short-circuit condition of the DC power line, which could varies from low rating (controlled DC power source) to huge rating (Battery storage). The related parameter of the SPD (Isccr) must be chosen higher than the prospective short circuit current of the DC power line.

Test standard

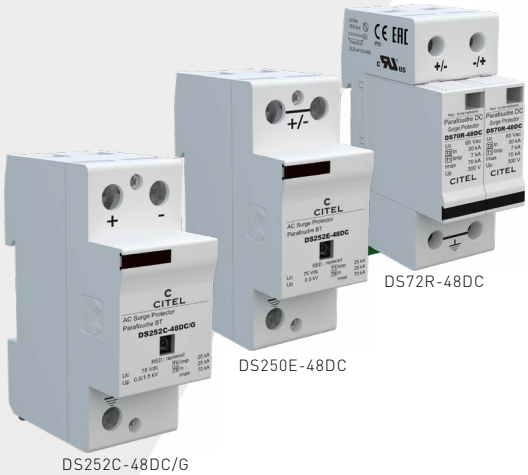
As the dedicated test standard is not published yet (prIEC61643-41), these DC power SPDs are tested following the existing tests and declare parameters similar to AC power SPDs like Uc (Maximum operating voltage in DC voltage), In (Nominal discharge current), Up (Protection level).

TYPE 1 DC POWER SURGE PROTECTORS

Range		Iimp/pole	Description	Page
DS252E-420DC		25 kA	Type 1 for 400 Vdc High energy 2-pole	76
DS252C-48DC/G		25 kA	Type 1 for 48 Vdc High energy 2-pole	75
DS250E-48DC		25 kA	Type 1 for 48 Vdc High energy 1-pole	75
DS132RS-420DC		12.5 kA	Type 1 for 400 Vdc Pluggable 1 or 2-pole	76
DS72R-48DC		7 kA	Type 1 for 48 vdc Pluggable 1 or 2-pole	75

TYPE 2 DC POWER SURGE PROTECTORS

Range		Imax/ pole	Description	Page
DDC50-21Y		50 kA	Pluggable High DC voltage Y diagram	78
DDC30-20		30 kA	Pluggable 1 or 2-pole	77
DDC*C-20		20-30 kA	Pluggable Compact version	79
DS210-DC		2-6 kA	Pluggable Compact version Differential/common mode protection	81
DDCN		3-6 kA	2-port SPD Compact version Differential and common mode protection	83



DS25x-48DC
DS7x-48DC

- Surge protector for 48 Vdc supplies
- Type 1 and Type 2
- Imax up to 70 kA
- Iimp up to 25 kA/pole
- Remote signaling (option)
- prIEC 61643-41 and UL1449 ed.5 compliance

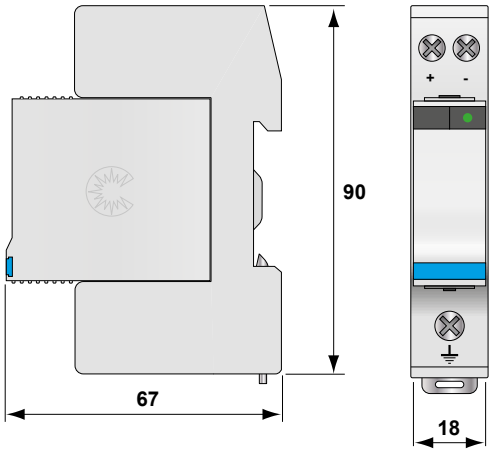
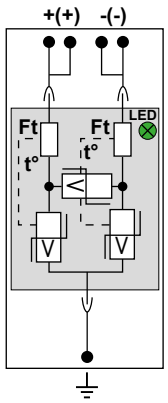
DS210-xxDC SERIES

- Surge protector for DC or PV powerlines
- From 12 to 130Vdc
- Imax: 2 to 6 kA
- Operating indicator
- Pluggable module
- EN 61643-11, CEI 61643-11 and UL1449 ed.5 compliance





V: Varistor
Ft: Thermal fuse
t°: Thermal disconnection system
LED : Disconnection indicator

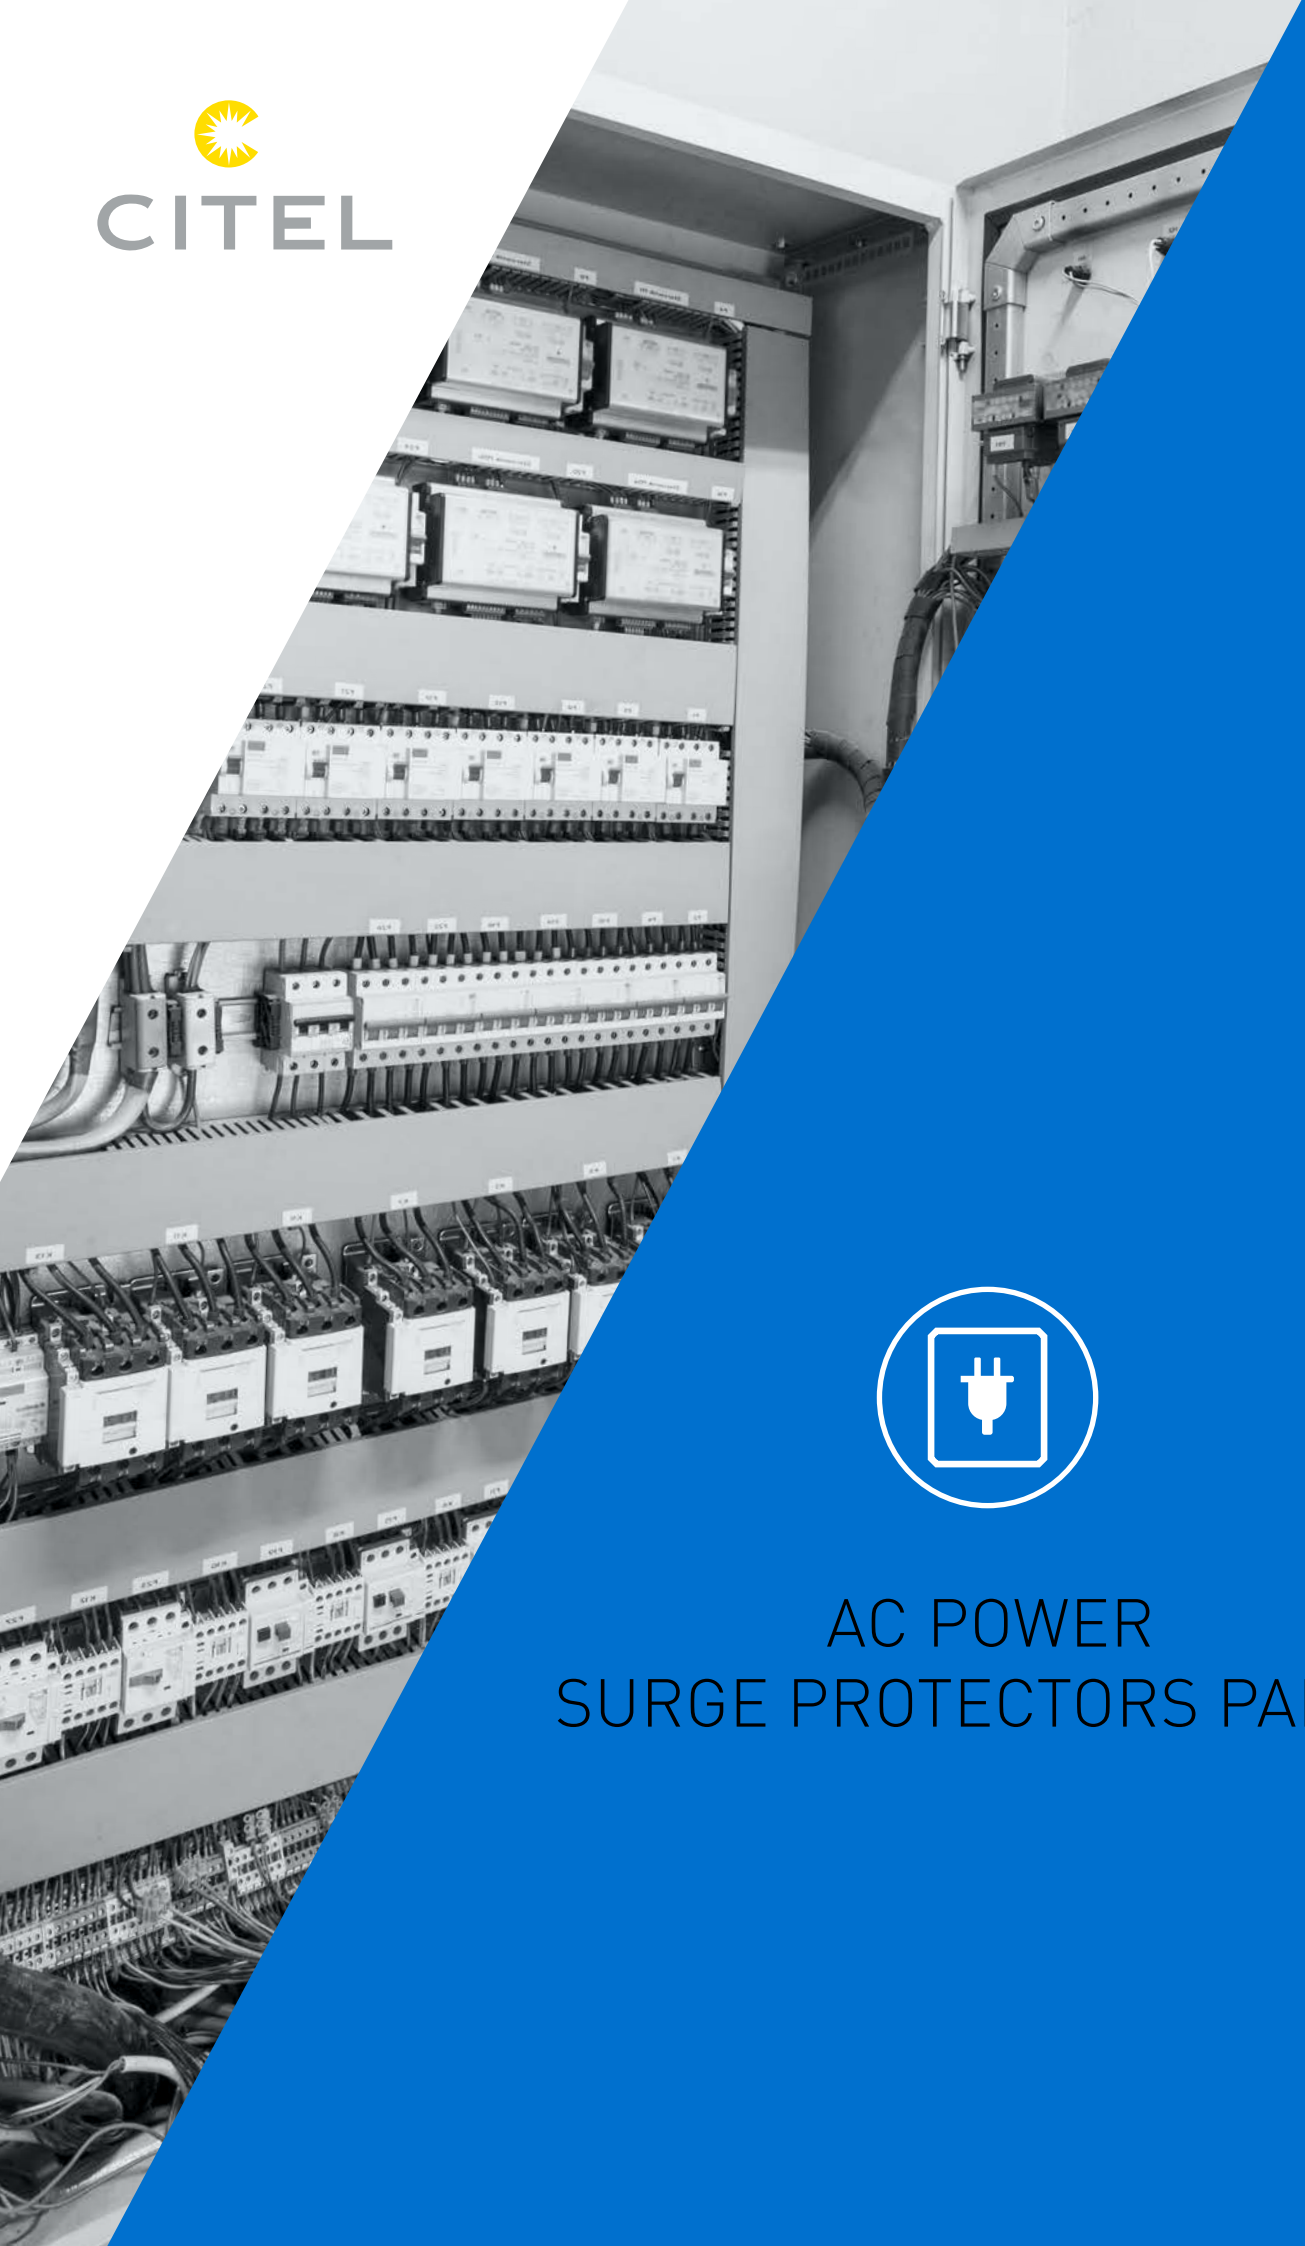
CITEL



AC POWER
SURGE PROTECTORS PANEL

AC SURGE PROTECTORS HARD-WIRED UNITS AND COMBINER BOXES

CITEL offers a line of surge protectors for the single and three phase AC networks connected to sensitive equipment.
These products, are available in various formats

- Hard-wired units single-phase (MSB, MLP)
- Hard-wired units and combiner box for US market (M series)

Series		Description	Characteristics	Page
MSB		Hard-wired SPD Type 2 or 3	compact	87 89
M50		Hard-wired SPD US market	Single-phase or 3-phase	91
MS MDS		SPD combi-ner boxes US market	Compliance UL1449 80 to 200 kA	90 93

HARD-WIRED SURGE PROTECTORS

MSB series

SPDs Type 2 or 3 for effective protection of sensitive equipment, in addition to the surge protector installation (coordination surge protector). Recommended installation near a sensitive equipment away from the surge protector (> 10 m). These surge protectors utilize a compact and economical scheme based varistors, to obtain a power flow relevant for secondary protection. They are more in accordance with IEC 61643-11, equipped with internal security which will disconnect the product of their networks for end of life. The operating condition of the arrester is signaled by light (or buzzer for version MSB6). Available in screw terminal connectors or wire terminals.

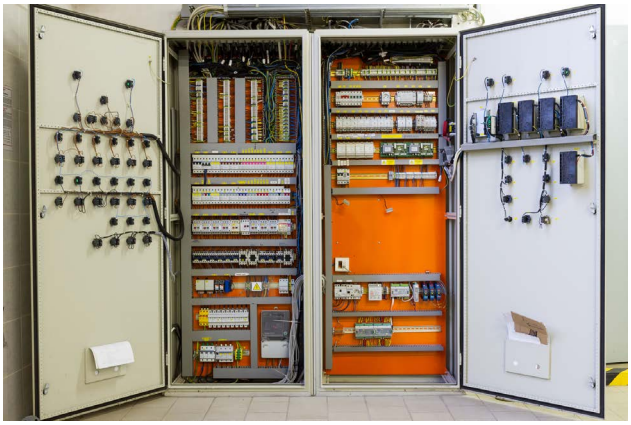
MLP/MLPC/MLPM series

Complete ranges of compact surge protectors specifically designed for the protection of outdoor lighting equipment with LED technology (see page 93).

STAND ALONE SPD ENCLOSURES

M series

M series surge protection devices (M50, MS and MDS) in metal enclosures belong to a complete family of surge protection devices specifically designed to meet the requirements of the North American surge protection standards: USA and Canada. Respectively, the UL1449 ed4 standard and the C22.2 No.269.1–22.2 No.269.5 standards. These standards define different categories of surge protection devices (SPD) and unfortunately use very close or identical terms compared to the SPD classification used in International standards. It is therefore crucial not to confuse these terms and understand their meaning based on the reference standards.



UL STANDARDS

The north American standard applicable to AC power SPD (UL1449 4thedition) proposes a different approach and classification from the international standard (IEC61643-11)

Type 1 - Permanently connected surge protection devices to be installed both, on the supply side and the load side of the equipment main overcurrent protective device. The surge protection devices are supposed to be self-protected against short circuits and do not require external protection.

Type 2 - Permanently connected surge protection devices to be installed on the load side of the equipment main overcurrent protective device. This surge protection device requires an external short circuit protection device.

Type 3 - Surge protection devices installed at a conductor length of 10 meters or greater from the electrical panel. For example, the mobile surge protectors (that can be plugged into the outlet such as a multiple power outlet etc.). They can also be directly installed on the equipment to be protected.

Type 4 « Component Assemblies » - Component Assemblies consisting of one or more Type 5 components and a disconnect complying with the limited end-of-life short circuit current tests (0.5A, 2.5A, 5A and 10A).
Type 1, 2, 3 « Component Assemblies » - Type 4 Component Assemblies having, in addition to the limited end-of-life short circuit current tests, passed all the other end-of-life tests (under the short circuit current of 100A, 500A, 1000A and SCCR) and also with (2CA) or without (1CA) external short circuit protection

Type 5 - Discrete component surge suppressors, such as MOVs, Diode or GDT that may be mounted on a PCB, connected by its leads or provided within an enclosure with mounting means and wiring terminations.
It is therefore clear from these definitions that Type 1 and Type 2

surge protection devices (according to the US-accepted terminology) are not necessarily linked to potential surge hazard as it is in the International approach (IEC). In UL standard, Type 1 and Type 2 surge protection devices are determined by the fact whether or not they need a short circuit protection. However, depending on the impulse tests, the minimum levels required for a Type 1, Type 2 and Type 3 surge protection devices are as follows :
Type 1 – 10kA or 20kA 8/20
Type 2 – 3kA, 5kA, 10kA or 20kA 8/20
Type 3 – 6kV/3kA 1,2/50-8/20

It is also understood that the location of the surge protection device imposed by its type is related to a certain stress level naturally being such that: the closer the surge protection device is to the mains connection point the greater its ability to withstand the surge.
Note that the maximum nominal discharge current is set at 20 kA (equivalent to International nominal discharge current (In) but it has no limitation and much lower in energy than the maximum impulse current (Iimp) of International Type 1).

Also important to remember that even if it is very tempting to compare the American voltage protection rating (VPR) and the International voltage protection level (Up), they are not (yet) comparable. The VPR is determined for any type of American SPD by using by a 6 kV/3 kA combination waveform generator.

The concept of "Listed" or "Recognized"

is important to understand particularly regarding the installation according to the American installation rules. A listed product is a device that any electrician can install on an installation (on site) without compromising safety. A recognized device cannot be installed on an installation. It can only be installed on a piece of equipment or a system (e.g. electrical cabinet) by professionals, at the factory, following certain rules and may be a subject to additional tests.

Imax parameter

Another disconcerting and confusing aspect is the maximum discharge current (Imax) values indicated for American surge protection devices:
- For an International surge protection device, the Imax value is defined by standards and must be tested if declared.
- For an American surge protection device, Imax has no official definition and is completely open to various interpretations by users and manufacturers.

The easiest interpretation is that the Imax does not represent a maximum single shock that the surge protection device can withstand but reflects its durability. This Imax is the algebraic sum of the individual Imax values of possible multiple varistors connected in parallel for each declared protection mode.
For example, if the protection mode (common in the USA) phase with the neutral and the ground connected (usually called "per phase") consists of 5 varistors between the line and the neutral and 5 varistors between the line and the earth (each varistor having an individual Imax value of 40kA), the final declared Imax value will be 5x40+5x40=400kA...
This type of value totally escapes from the International logic but is useful information for American users as it gives an idea of the surge protection device capacity in terms of its service life.
Other example, a surge protection device with a In of 20kA and declared Imax of 40kA will not be able to withstand much more than 20 shocks of 20kA. On the other hand, a surge protection device having the same In of 20kA and declared Imax of 400kA will be able to withstand more than 2000 shocks of 20kA!
Conversely, the International Type 1 design with its characteristic of 10/350 wave maximum impulse current (Iimp) is completely unknown (and rejected) in the USA.

5th Edition	**Line Side of Main Disconnect**	**Load Side of Main Disconnect**	**Local Equipment**	**Surge component + Thermal Disconnect (component assembly)**	**Surge Component Only**

M50 SERIES

M50-120Y-A

- For AC Single Phase and 3-phase network (wye, delta, split phase)
- In: 20 kA
- Imax: 50 kA
- No leakage current
- Visual indicator and audible alarm
- Formats: side or back nipple
- UL 1449 5th Ed. certification

LED SYSTEMS
SURGE PROTECTORS

SURGE PROTECTORS FOR LED LIGHTING SYSTEM

LED street lighting is now widely used for its efficiency, its energy cost savings and its life expectancy.
Nevertheless this attractive technology has an important weakness: its sensitivity to transient voltages created by lightning or by power switch operations on AC network.

Due to its scattered and over-exposed location, LED lighting system will face induced surges which will create failure of its power supply, damage LED components or loss of the lighting efficiency. For these reasons, the use of relevant surge protectors located upstream the LED lighting systems is highly recommended.

CITEL offers a full range of surge protectors designed to be installed at different points on the lighting network such as streetlights, the base of poles and street cabinets.
CITEL offers solutions adapted to every type of outdoor LED lighting systems : urban, architectural, tunnels etc...

SURGE PROTECTORS FOR LED LIGHTING SYSTEMS

MLPM and MLPC series

The MLPM and MLPC ranges are compact surge protectors to be installed in small spaces. These devices have a same footprint and are equipped with mechanical (MLPM range) or light (MLPC range) disconnection indicator. MLPM provides spring contact connection whereas MLPC is available in 2 types of connectors (screw terminal or spring) and in two orientations wiring (input / output opposite or input / output on the same side) in order to adapt to the installation as much as possible.
In cases of extreme aggression, these SPDs will switch in failsafe mode : the indication of failure (disconnection) of the surge protector will be provided by an indicator and the switching off the AC power (extinction of the luminaire) will inform the user of the need for maintenance.

MLP series

MLP range is a complete range of AC surge protectors specifically designed by CITEL for the protection of LED lighting systems at the lantern.
Many versions have been proposed to meet the various existing configurations : surge protection devices are available in different isolation classes (Class I, Class II) and connection type (wire or screw terminal) and equipped with additional protection for data line (RS485, DALI, 0-10V) to provide a complete solution for LED systems with control lines.

In cases of extreme aggression, the surge protector will be in a state of retirement security: according to the different versions available, an indication of the failure of the surge protector is performed by the extinction of an indicator, a AC power disconnection and / or through a remote signalisation.

Series	Description	Characteristics	Page
MLPC **MLPC-VG** 	Compact Hard-wired surge protector Type 2 (or 3)	Compact. Many configurations	99
MLPC1-230L-V/2L 	Compact Hard-wired surge protector Type 2 (or 3)	Compact, 2-phase+N	102
MLPC1-230L-V/DL 	Combined Hard-wired surge protector Type 2 (or 3)	Compact AC/Data	103
MLPC2/ESP2 	Surge and electrostatic protector	Class II Electrostatic protector	104
MLPM 	Compact Hard-wired surge protector Type 2 (or 3)	Compact. Mechanical indicator	101
MLP 	Hard-wired surge protector Type 2 (or 3)	Remote signaling and Data in option	105
MLPX 	Ultra-compact hard-wired surge protector Type 2 (or 3)	Ultra compact IP67 VG Technology	107
MSB6 	Hard-wired surge protector Type 3	Very Compact. Buzzer indicator	89
DSLP **DLPM** 	DIN surge protector Type 2 (or 3)	Compact. Montage DIN	109 110
DS98L 	DIN surge protector Type 2 (or 3)	Double connector. DIN mounting	111
MLPVM2 	Combined protection for Surge, Temporary and Permanent overvoltages	Class II SPD and POP stages	112

MLPX series

The MLPX range is an compact surge protection solution for installation in tight spaces.
These surge protectors are available with an output by wires and fixing bracket. In the end of life of security the MLPX indicates its failure (disconnection) by the extinction of an indicator and AC power supply switching off (extinction of the luminaire) inform the user of the need for maintenance.
Its IP67 rating makes the MLPX usable in harsh conditions.

MSB6 series

These very compact surge protectors can be integrated in the very small volumes of certain lights (e.g LED strips). The surge protection circuit is equipped with an end of life indicator buzzer in order to indicate the disconnection of the surge protector.

DSLP / DLPM series

This device is installed inside the bottom of the lighting pole : its very compact dimension allows a easy integration with the connection box, on DIN rail .
DSLP1 is based on a powerful association of MOV and GDT components, secured by thermal disconnector and disconnection light indicator. The DLPM version offers a mechanical indicator in order to inform about the status of the SPD without voltage supply.

DACN10-L series

The DACN10-L range is a series of AC surge protector for DIN assembly designed to be installed inside boxes at the bottom of poles: its high load current and double output connection allow several LED circuits to be protected. The DACN10-L is based on an efficient combination of a varistor and a gas discharge tube, secured by thermal disconnector and status indicator.

Street cabinet protection

In order to ensure the real security of the lighting network, the main AC cabinet must also be protected by surge protection devices: surge protectors on the AC network (e.g.: DAC50 range) and, if present, surge protectors on the dataline (e.g.: DLA range).

SURGE PROTECTORS INSTALLATION

MLPC SERIES

- Type 2 (or 3) surge protectors for Led lighting
- Very compact
- Plate mounting
- VG technology version
- Screw terminal or spring terminal connection
- Status indicator
- End of life AC Disconnection
- IEC 61643-11 and EN 61643-11 certification

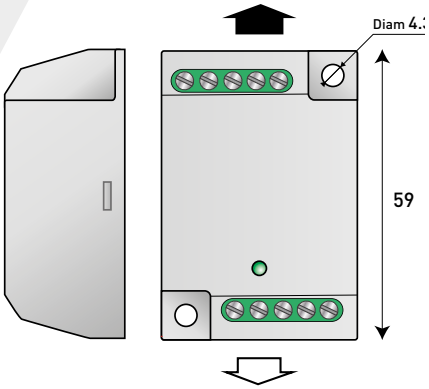
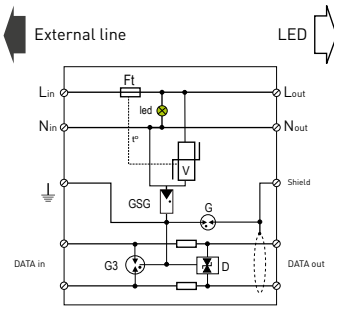
- **Type 2 (or 3) surge protector for Class 1 LED lighting**
- **Combined AC/Dataline surge protection**
- **DALI, DMX, RS485, 0-10V dataline compliance**
- **Shield wire management**
- **Optimized coordination with driver (option: MLPCH1-230L-V/DL)**
- **Screw connection**
- **Imax : 10 kA**
- **EN 61643-11, IEC 61643-11 compliance**





V : Varistor
Ft : Thermal fuse
GSG : Specific gas tube
G : 2-electrode gas tube
G3 : 3-electrode gas tube
D : Clamping diode
L : Coordination inductor (option)
LED : Status indicator

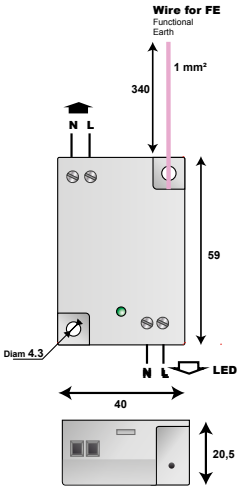
Characteristics

CITEL model		MLPC1-230L-V/DL
Description		AC/Dataline SPD for LED lighting system Class 1
AC power Characteristic		
Network		230 V single phase
AC system		TT-TN
Protection mode(s)		L/N and N/PE
Max. AC operating voltage	Uc	320 Vac
Max. Load current	IL	5 A (2,5 A)*
Residual current - *Leakage current at Uc*	Ipe	None
Temporary over voltage (TOV) characteristics 5sec.	UT	335 Vac withstand
Temporary over voltage (TOV) characteristics 120 mn.	UT	440 Vac disconnection
Nominal discharge current - *15 x 8/20µs impulses*	In	5 kA
Max. discharge current - *max. withstand @ 8/20 µs*	Imax	10 kA
Withstand on Combination waveform	Uoc	10 kV / 5 kA
Protection level L/N *@In (8/20µs)*	Up	1.5 kV
Protection level N/PE *@In (8/20µs)*	Up	1.5 kV
Admissible short-circuit current	Isccr	10 000 A
Thermal disconnectors		internal
Connection to network		Screw connection : 1,5 mm² max
Voltage/operating indicator		Green Led ON
Failsafe behavior		Disconnection, Green Led OFF and AC line cut-off
Specific version for optimized coordination with driver		MLPC**H**1-230L-V/DL*
Dataline Characteristics		
Network		DALI/DMX/RS485/0-10V
Dataline configuration		1-pair + shield
Nominal line voltage	Un	24 V
Max. DC operating voltage	Uc	28 V
Max. Load current	IL	300 mA
Max. frequency	f max	10 mHz
Insertion loss		< 1 dB
Nominal discharge current - *15 x 8/20µs impulses*	In	5 kA
Max. discharge current - *max withstand @ 8/20µs*	Imax	10 kA
Protection level L/L or L/PE	Up	50 V
Protection level Shield/PE	Up	< 600V
Connection to network		Screw connection: 1,5 mm² max
Failure indication		Transmission cut-off
Mechanical Characteristics		
Dimensions		see diagram
Mounting		on plate
Operating temperature		-40/+85°C
Protection rating		IP20
Housing material		Thermoplastic UL94 V-0
Standards		
Compliance		EN 61643-11 / IEC 61643-11
Part number		
		831223

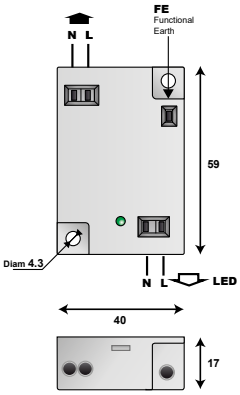
MLPC2/ESP2 & ESP-230

- Type 2 (or 3) Surge & Electrostatic protectors
- For Class II Led lighting
- Version Electrostatic protector only: ESP-230
- Electrostatic protection included: MLPC2
- Plate mounting
- Screw terminal or spring terminal connection
- Status indicator
- End of life AC Disconnection
- IEC 61643-11 and EN 61643-11 compliance

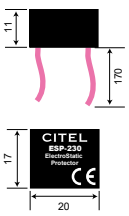
Characteristics



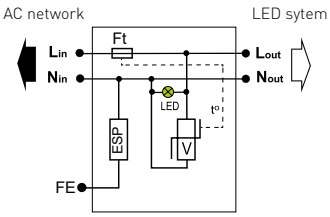
MLPC2-230L-V/ESP2



MLPC2-230L-R/ESP2



ESP-230



Ft : Thermal fuse
Led : Status indicator
V : MOV
t°: Thermal disconnection system
ESP: Electrostatic protection
FE: Functional Earth

CITEL Model		MLPC2-230L-V/ESP2	MLPC2-230L-R/ESP2	ESP-230
Description		Surge & Electrostatic protectors for Class II LED lighting		Electrostatic protectors for Class II LED lighting

MLP1-230L-W/DL

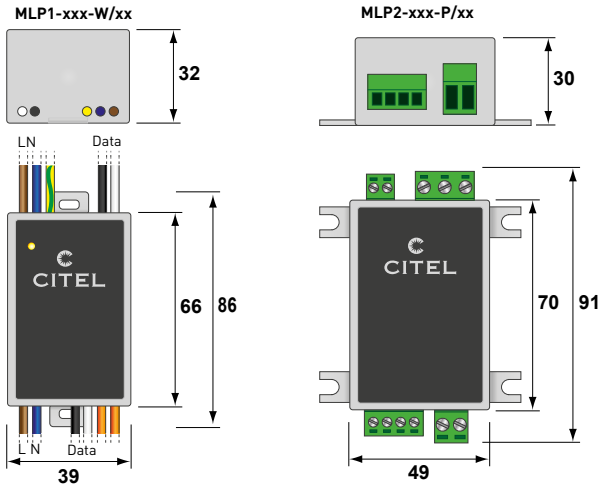
- : No dataline surge protection
DL : Data transmission surge protection

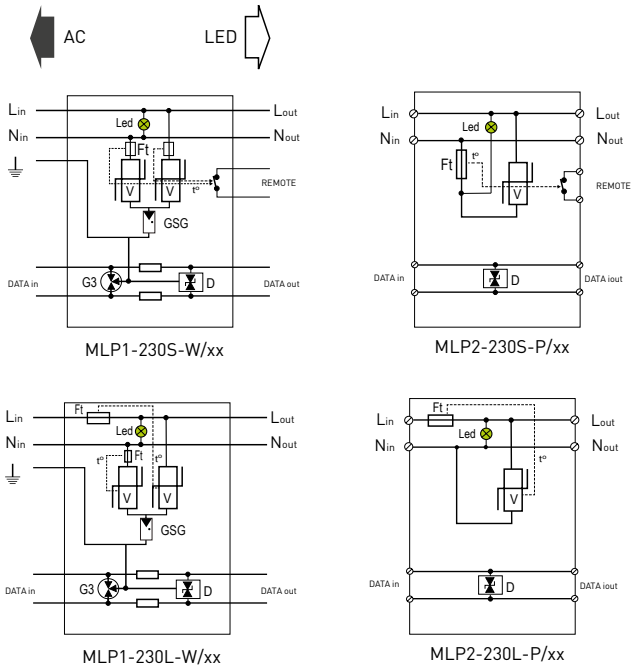
W : Wire connection
P : Pluggable screw terminal connection

L : Line disconnection failure mode without remote signal
LS : Line disconnection failure mode with remote signal
S : Parallel disconnection failure mode with remote signal
- : Parallel disconnection failure mode without remote signal

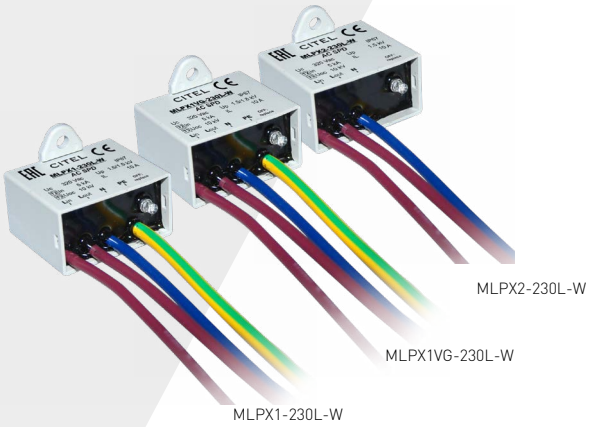
230 : 220-240 Vac voltage
120 : 110-120 Vac voltage

1 : Class I equipment
2 : Class II equipment





Ft : Thermal fuse
Led : Status indicator
V : Varistor
GSG : Specific Gas Tube
G3 : 3-pole Gas Tube
D : Clamping diode network
Remote : Contact for remote signalling
t° : Thermal disconnection system



MLPX SERIES

- **Ultra compact surge protector for 230 Vac networks**
- **For Class I and Class II**
- **Breakable mounting bracket**
- **Protection rating: IP67**
- **VG Technology (MLPX1VG and MLPX2VG)**
- **Improved coordination with driver (VG versions)**
- **Disconnection signaling by indicator**
- **AC disconnection in case of end of life**
- **EN 61643-11/IEC 61643-11 certification**

CITEL

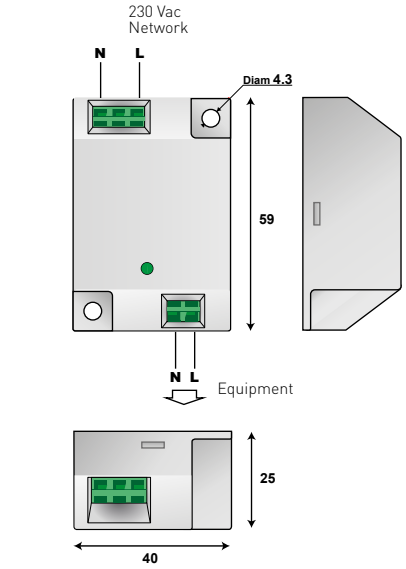
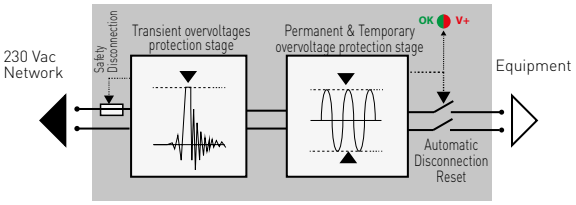
MLPVM2-230L-5A

- **Protection against all types of overvoltages**
- **For Class II Led lighting**
- **230 V single-phase network / 5 A**
- **Function «Surge voltage protection» (SPD)**
  - **Nominal discharge current 8/20µs : 5 kA**
- **Function «Permanent or temporary Overvoltage Protection» (POP)**
  - **Overvoltages due to network quality, Neutral failures, wiring mistakes**
  - **AC overvoltage detection > 270 Vac**
  - **Automatic reset after defect disappears**





Characteristics

CITEL model		MLPVM2-230L-5A
Description		Protection against Surge, Temporary and Permanent overvoltages
Isolation class		Class II
Network	Un	230 V single-phase
Max Load current	IL	5 A
Function «Surge voltage protection»		
Protection mode		L/N
Max. AC operating voltage	Uc	255 Vac
Nominal discharge current	In	5 kA
Protection level L/N	Up	1.5 kV
Admissible short-circuit current	Isccr	10000 A
Function «Permanent or temporary overvoltage protection»		
AC overvoltage detection	Udisc	270 Vac
Disconnection time		0.1 ms typical
Reset time		10 s typical
Switching capability		L and N cut-off / 5 A @ 250 V
LED indicator		Green : voltage OK Red : overvoltage (disconnection)
Mechanical characteristics		
Dimensions		see diagram
Mounting		on plate
Connection to network		in series by conductors 1.5 mm² - spring terminal
Operating indicator		Led green ON
Surge protector Failsafe behavior		Disconnection and AC line cut-off
Surge protector Disconnection indicator		Led green OFF and AC network cut-off
Operating temperature		-40/+85°C
Protection rating		IP20
Housing material		Thermoplastic UL94 V-0

PHOTOVOLTAIC SURGE PROTECTORS

SURGE PROTECTORS FOR PHOTOVOLTAIC SYSTEMS

Most photovoltaic module manufacturers guarantee their materials for 20 years or more.The ROI of photovoltaic generation facilities connected to the low voltage network is therefore calculated over this long period of time. But these systems are often highly exposed to lightning and power surges, which can greatly reduce the required operating time. Implementation of appropriate protection solutions is strongly recommended, and sometime mandatory depending on the local regulations.

Several points must be considered to analyze the risk of lightning and switching surges on PV installations:

- Due to the exposed nature of the PV array, the threat of «lightning» is more common.
- The risk is multiple: direct effect (lightning strike on the panels) and indirect (surge on cells, solar chargers / inverters, on other lines (data)).
- The operating loss must be taken into account, especially at sites of high power capacity.
- When the Photovoltaic system is located on industrial sites, the risk of switching overvoltages must also be taken into account.
- The level of risk is directly related to the lightning density and exposure of local lines

The IEC61643-32 international guide gives the relevant information about the need of protection, the selection and the installation of the surge protective devices.

PROTECTION OF PV INSTALLATION

The photovoltaic grid-connected low voltage power lines may be subject to overvoltages on different networks:

- **AC network**: surge protectors are necessary, and in most cases, mandatory on the AC output of the PV inverter which is connected back to the AC power grid.

- **DC network**: surge protectors are required or mandatory on the input of the PV inverter and, in some conditions, the input of the PV modules.

- **Communication network:** if the PV inverter is connected to signal lines (probes, sensors, monitoring) then surge protectors are highly recommended on these networks.

AC SURGE PROTECTORS FOR PV INSTALLATION

Depending on the type of networks, the presence of lightning rod or primary surge protectors existing, CITEL offers a complete range of solutions to protect the AC part of the PV system.

Installations with lightning rods

A Type 1 surge protector, specifically dimensioned to handle direct lightning current is required at the service entrance of the installation (main switchboard). Surge protectors like the DAC1-13 provide a high energy surge capacity in a compact size and are easily serviced with pluggable modules.

Standard installation

In the absence of lightning rod, the implementation of a Type 2 SPD is generally preferred,but, in some cases, it is compulsory depending on the level of lightning in the area (Ng> 2.5). The DAC50 Type 2 SPD range offers a modular solution adapted to these applications. For medium and small size facilities with limited space available, the DAC40C provides a high surge capacity in a reduced footprint.

Input protection of PV inverter

IEC61643-32 guide requires the implementation of an additional SPD on the AC input of the PV inverter, if it is more than 10 m from the primary surge protector. The DAC15C surge protectors provide this protection for these applications and can be installed either directly into the distribution panel or in a dedicated, standalone enclosure solution.

SURGE PROTECTORS FOR DATALINES

The PV system can be interconnected to various datalines networks including probes, sensors, and monitoring equipment. In these cases, the implementation of suitable surge protectors is highly recommended: The DLA range performs this function and is available for any type of telecom or data line connections

DC SURGE PROTECTORS FOR PV INSTALLATION

CITEL has designed a complete range of Type 1 and Type 2 surge protectors for these applications that are compliant with the IEC61643-31 (or EN50539-11) test standard.

.

SELECTION OF SURGE PROTECTORS FOR PV POWERLINES

The IEC 61643-31 test standard (or EN 50539-11) defines the SPD parameters and the IEC 61643-32 allows the selection and gives information regarding SPD installation on the DC side of the PV installation.

Main Parameters

Types of SPD

Similar to AC power SPDs, those used on DC power are qualified following types :

- Type 2 SPD: used when direct lightning strike is not taking into account (no LPS). Tested with the parameter In (Nominal discharge current 8/20µs).
- Type 1 SPD : must be used in case of possible direct strike (LPS on installation or wide PV farm). Tested with the parameters Iimp (10/350µs Impulse current by pole) and Itotal (10/350µs Total Impulse current).
- see «Selection and Location of SPD» table, below

Maximum DC voltage (Ucpv)

Maximum DC voltage applicable continuously to the SPD. Must be higher than the maximum PV voltage of the installation (Uocstc).

Short-circuit current withstand (Iscpv).

The surge protector must safely withstand (failsafe disconnection) a end-of-life test on a declared short-circuit current. This Iscpv parameter must be higher than the maximum short-circuit of the PV line (Iscstc).

Protection level (Up)

Must be lower than the impulse withstand (Uw) of the equipment of the PV installation (Inverter, PV modules).
The IEC61643-32 gives some typical ratings.

Nominal discharge current (In)

The repetitive withstand in 8/20µs current impulse of the Type 2 SPDs must be equal or greater than 5 kA. Higher ratings (15 to 20 kA) gives a longer prospective life duration to the surge protectors.

Impulse current (Iimp and Itotal)

The 10/350 impulse withstand on one pole (Iimp) or 2 poles together (Itotal) for Type SPD 1 are related to the installation configuration.
Typical values :

- Iimp 5 kA (Itotal 10 kA) for the installation equipped with LPL III or IV Ligthning Protection System or free PV field.
- Iimp 10 kA (Itotal 20 kA) for a PVinstallation equipped with LPL I Ligthning Protection System.

Selecting and locating SPDs on a PV system connected to the AC grid

According to IEC61643-32, the location and type of SPD to be installed on AC and DC networks depend on several criteria (PV on building/PV field, presence of LPS, interconnection, length of lines).
The table opposite describes the main configurations.

	PV on building equipped with LPS				PV field	PV on building without LPS	
LPS	yes	yes	-	-	no	no	no
LPS isolated	-	-	yes	yes	-	no	no
PV field	-	-	-	-	yes	-	-
LAC	> 10 m	< 10 m	> 10 m	< 10 m	> 10 m	> 10 m	< 10 m
LPV	> 10 m	< 10 m	> 10 m	< 10 m	> 10 m	> 10 m	< 10 m
SPD1	AC Type 1+2	AC Type 1+2	AC Type 1+2	AC Type 1+2	AC Type 2	AC Type 2	AC Type 2
SPD2	AC Type 1+2	without	AC Type 2	without	AC Type 2	AC Type 2	without
SPD3	PV Type 1	PV Type 1	PV Type 2	PV Type 2	PV Type 1	PV Type 2	PV Type 2

CITEL RANGE FOR PV SURGE PROTECTORS -DIN RAIL MOUNTING

Type 1 surge protectors

When the installation is equipped with lightning rods or for open free PV fields (following IEC61643-32), it is mandatory to install SPD dimensioned for a direct lightning impulse (10/350µs).

- **DS60VGPV/51 series:**
  Type 1 SPDs withstand @10/350µs up to 12.5 kA by pole (Iimp) and 25 kA (Itotal).
  With CITEL's exclusive, patented «VG Technology». Comply with IEC61643-31 (and EN50539-12) product test.

- **DS50PV/12KT1 and DS50VGPV/12KT1 series:**
  These Type 1 pluggable SPDs have a current total of 12.5 kA (Itotal) and are required when the likely direct current lightning is not maximal or for free PV field.

Type 2 surge protectors

In most installations, the SPD will be necessary or mandatory and will be of type 2. CITEL offers 2 ranges with pluggable module design:

- **DS50VGPV/51 series** : This version is based on VG technology, insuring a total absence of leakage current and maximum reliability. Comply with EN50539-11 product test.

- **DS50PV/51 series** : based on the use of specific varistors, providing a protection in common mode or differential and common mode. Comply with EN50539-11 product test

CITEL RANGE FOR PV SURGE PROTECTORS - PCB MOUNTING

Surge protector requirements of PV inverter manufacturers have evolved. To save space in the cabinets, the manufacturers have decided to replace DIN rail surge protectors by PCB-mounted SPDs : these ones are designed to be mounted directly inside the inverters, soldered on the internal PCB.
Beyond PV applications, the AC version of these PCB-mounted SPDs could also be used for other applications, where high integration and lower cost are required (i.e charging station for electrical vehicles).
CITEL has developed two dedicated product ranges : PPV (PV power SPD) and PAC (AC power SPD)

PPV range

The PPV range (Type 2 or Type 1 + 2) is designed to protect the DC side of photovoltaic inverters.
The single pole module must be soldered on a PCB, in parallel to the DC network.
Every configuration (Y-diagram, V diagram-circuit, Delta diagram) can be realized, related to the application
The pin-out of the module is the same regardless of the version (T1 or T2) or Ucpv voltage, facilitating the
switching from one to the other.

- T1+2 : Iimp = 6,25 kA
- T2 : Imax 40 kA or 25 kA
- Remote signaling
- IEC 61643-31 compliance

PAC range

The PAC range (Type 2 or Type 1 + 2) is designed to protect the AC side of photovoltaic inverters.
The single pole module must be soldered directly on the PCB, in parallel to the AC network.
The pin-out is the same whatever the Uc voltage.

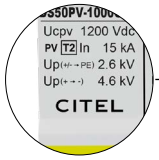
- Uc: 275, 420 or 680 Vac
- Imax: 25 kA or 40 kA
- T1+2 : Iimp = 6,25 kA
- Remote signaling
- IEC 61643-11 compliance

Application

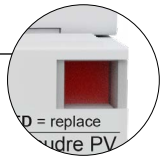
In order to reach the relevant specifications, the PCB where the PPV or PAC SPDs will be used must be carefully designed by the customer.

DS50PV/51, DS50VGPV/51 and DS50VP/12KT1 series

Pluggable module
Disconnection for simplified maintenance.
Standardized marking

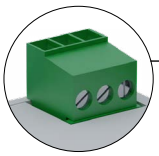


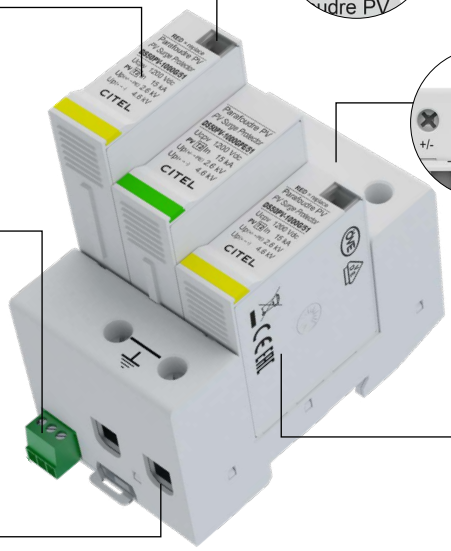
Status signaling
In case of safety disconnection, the indicator switches to red: module to replace.



Connectors
Significant physical separation of the screw terminal blocks: ensuring insulation between polarities even for high DC voltages

Remote signalling
Option to remotely monitor the status of the surge protector. Simplified cabling thanks to a single terminal for monitoring all poles.





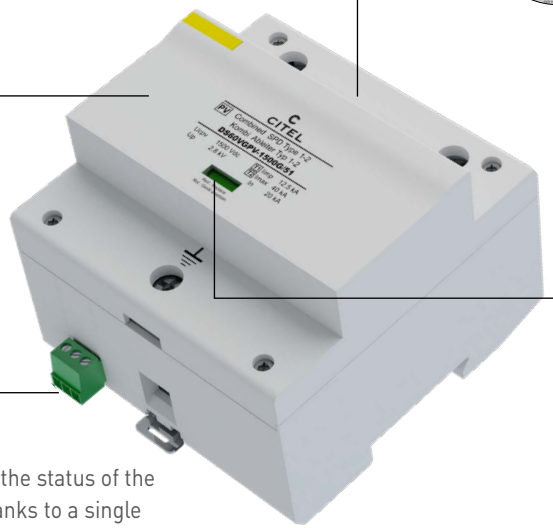
Versions
Type 2: DS50PV/51 et DS50VGPV
Type 1+2: DS50PV/12KT1 and DS50VGPV/12KT1

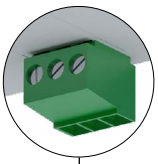
Earth
Double connector for optimized connection ground network.

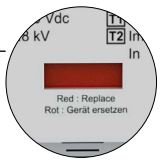
DS60VGPV/51 series

VG Technology
Efficiency and reliability maximum

Connectors
Significant physical separation of the screw terminal blocks: guarantee insulation between polarities even for high DC voltages







Status signaling
In case of safety disconnection, the indicator switches to red: SPD to replace.

Remote signalling
Standard feature to remotely monitor the status of the surge protector. Simplified cabling thanks to a single terminal for monitoring all poles.

PROTECTION OF ISOLATED (OFF-GRID) PV SYSTEMS

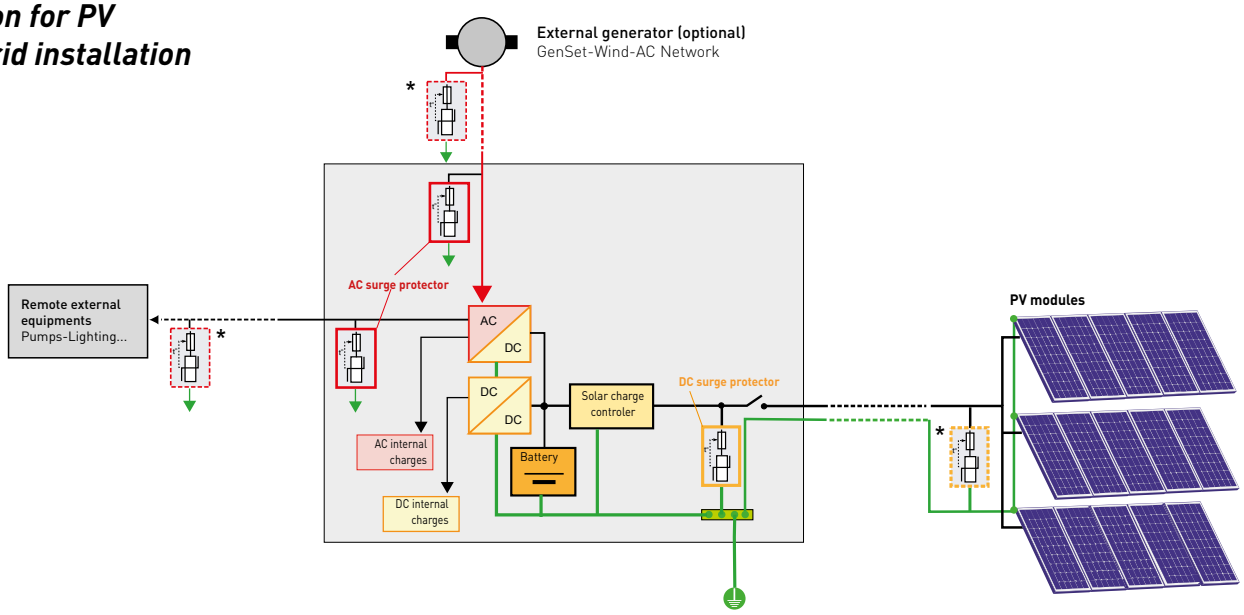
The exposure and location of remote sites powered by isolated PV systems not connected to the AC network are at a very high risk of failure due to transient surges.
Unlike the sites connected to the distribution network, PV equipment failure at a remote site will result in a total operating loss: thus, the implementation of appropriate surge protection is strongly recommended.
The selection and installation of surge protectors for off-grid sites will be defined in the UTE C15-712-2 guide.

PROTECTION OF ISOLATED (OFF-GRID) PV SYSTEMS

CITEL offers a wide range of SPDs dedicated to off-grid PV installations, with extended operating voltages from 12 to 350 Vdc.

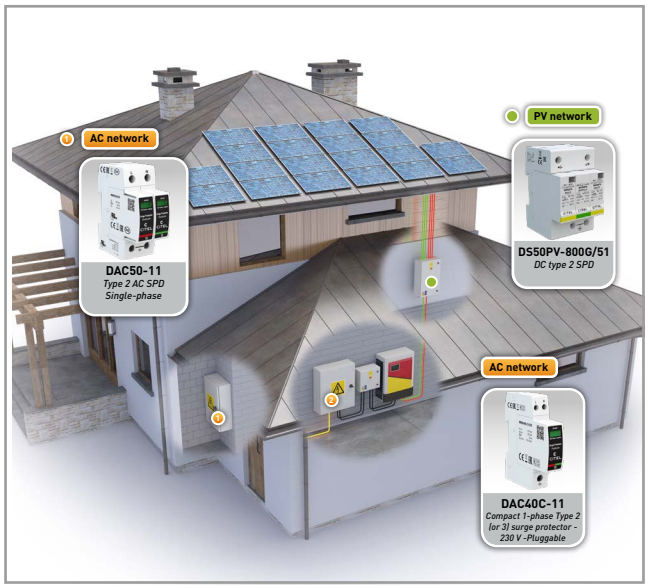
DDCxx and DDCxxC are pluggable surge protectors used for DC or PV powerlines. Especially compacts, they can easily be installed in off-grid installations.
If the off-grid installation is connected to outdoor equipment, SPDs must also be used on these networks in order to provide a global and efficient protection.

Surge protection for PV powered off-grid installation



**) Surge protectors at the terminals of the equipment more than 10m away from the facility*

PROTECTION OF PHOTOVOLTAIC INSTALLATIONS



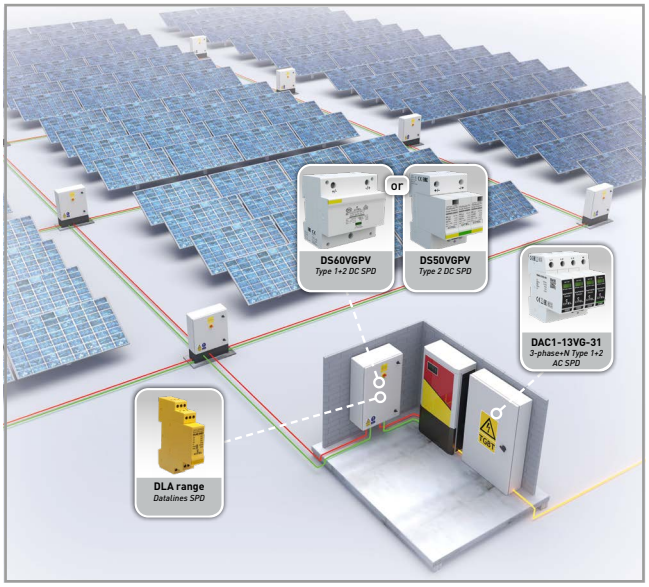
Residential Photovoltaic installation

The IEC61643-32 installation guide gives the relevant information to manage the safe operation of PV installation in case of surge due to lightning. For small power plants (residential and small commercial), AC input (connection to the grid) and DC out should be protected.

The implementation of the SPD may be mandatory for some cases. However, if the reliability and longevity of the PV system are the primary objectives then the implementation of surge protectors is always recommended.

Business/Building Photovoltaic installation

Commercial or industrial sites can integrate very large photovoltaic systems into their power generation strategy. These applications are vulnerable to lightning and transient surges which can cause significant downtime and losses. The implementation of SPDs at key locations throughout the facility is necessary to ensure the reliable operation of the plant.
If the building is equipped with LPS, Type 1 SPDs are required on the AC and PV side of the inverter.



Photovoltaic Power Plant

Photovoltaic power plants have a high risk of lightning strikes due to their large surface area and exposed location. This expensive and sensitive equipment is vulnerable to lightning strikes. It may result in direct replacement costs and operation downtime losses. Thus implementation of SPDs on AC, DC and communication lines are highly recommanded.
To comply IEC 61643-32 guide, Type 1 SPDs with a minimum limp rating of 5 kA are required on the DC side of the PV inverter.

DS60VGPV-1500G/51

DS60VGPV/51 SERIES

- VG-Technology
- No leakage, no operating currents
- Improved life expectancy
- Iimp/Itotal 12.5 / 25 kA @ 10/350µs
- Common and Differential mode protection
- Remote Signaling
- EN 50539-11 compliance
- VDE and OVE approved

TELECOM & DATA LINE SURGE PROTECTORS

TELECOM-DATA LINE SURGE PROTECTORS

Telecommunication and data transmission devices (PBX, modems, data terminals etc..) are becoming increasingly vulnerable to lightning-induced voltage surges.
These devices are becoming more complex, sensitive and share a common grounding connection with other networks. This situation increases the risk for these sensitive devices to be stressed by destructive surge voltages, induced by lightning or by electrical switching operations.
Moreover, these devices are nowadays installed at every level of every installation (industrial, commercial and residential buildings), making these possible disturbances unacceptable and/or costly.
To make this telecom or data equipment sufficiently reliable, the installation of a dedicated surge protector, against transient overvoltages, is highly recommended.

SURGE PROTECTORS FOR TELECOM AND DATA LINES

Surge protectors for telecom and data transmission equipment could be divided in 3 types:

- Surge protectors for telecom networks
- Surge protectors for datalines and industrial networks
- Surge protectors for Local Area Networks (LANs)

CITEL products differ by their electrical diagrams and their mechanical configurations, adapted to the need of each type of network.

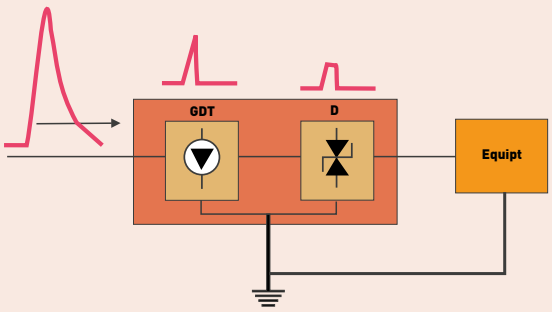
Reminder:
Devices connected to telecom or data networks, are also connected to the AC distribution network: in order to ensure a coordinated protection, surge protectors must be installed on each inter-connected networks.

TECHNOLOGY OF SURGE PROTECTORS

All CITEL telecom and data line surge protectors are based on reliable multistage hybrid design that combines a high discharge current capacity with fast response time.
All CITEL telephone and data line surge protectors use a combination of a 3-electrode gas discharge tube and fast clamping diodes, in order to provide:

- A nominal discharge current (repeated without destruction) greater than 5 kA @ 8/20 µs impulse
- An ultrafast response time < 1 ns
- Safety operation in end of life (Fail-safe behavior: end of life Mode 2 following EN 61643-21)
- Low insertion losses to not disturb the transmission signal.
- The systematic use of 3-electrode gas discharge tubes provides optimum protection through simultaneous sparkover.

2-stage diagram for Telecom/Dataline SPD



GDT: Gas tube stage for high energy discharge

D: Clamping diode stage for fast responce time and low residual voltage

This set of characteristics is essential for optimum reliability of the protected equipment whatever the incident or disturbance.

Various protection diagrams are available according to requirements and the type of network to be protected:

- Standard protection, used mainly for the analog telecom network
- Enhanced protection, for very low voltage transmission lines.
- Line+Shield Protection: Transmission and protection for shield wire.
- «Low capacitance» surge protection for high bit rate links (> 1 Mbit/s)
- Indicator or remote signalling in case of end of life

STANDARDS

Tests procedures and installation recommendations for comunication line surge protectors must comply the following international standards:

- **IEC 61643-21**:
  Tests of surge protectors for communication lines.
- **IEC 61643-22**:
  Choice/installation of surge protectors for communication lines.

Specific tests following EN/IEC 61643-21 standard

Surge protectors for communication lines must be tested following various categories in order to declare their impulse durability:

- **C2 Category**: 10 x 8/20µs current impulses from 1 to 5 kA
- **C3 Category**: 300 x 10/1000µs current impulses from 10 to 100 A
- **D1 Category**: 2 x 10/350µs current impulses from 0.5 to 2.5 kA

As the surge current capabilities of CITEL Telecom/dataline SPDs are very high (typically Imax 20 kA), their possible end of life is very unlikely.
Nevertheless, default modes on AC or impulse stress must be tested and declared. 3 default modes are defined by standard:

- **Mode 1**: disconnected SPD but line transmission still active
- **Mode 2**: short-circuited SPD, so line transmission off.
- **Mode 3**: Failed SPD and line transmission off (in-line cutoff).

Typical diagrams for Telecom/Dataline SPD (for 1 pair)

GB: 2-electrode gas tube
R: Line resistor
D: Fast Clamping Diode
D3: 3-pole Clamping Diode
DBC: Low capacitance clamping diode

TELECOM-DATA LINE SURGE PROTECTORS

USE OF SURGE PROTECTORS

In areas where standards are lacking or non-existent, the decision to use surge protectors on telecom and data lines can be taken by the following:

- The recommendation of the equipment manufacturer
- Corrective action following equipment damage due to transients
- Preventive action following risk assessment (IEC62305-2)
- Preventive action following a simplified risk assessment (below)

Simplified Risk assessment

In order to assess quickly the probability of the lightning surges and theirs consequences, a simplified risk analysis could be performed following the table below.

Parameters	Low Risk	High Risk
Lightning density (Ng)	*< 2,5*	*> 2,5*
Site configuration	*Single building*	*Multiple buildings*
Transmission length	*Short*	*Long*
External lines distribution	*Underground*	*Overhead*
Electrical disturbances	*Low*	*High*
Existing lightning rod	*No*	*Yes*
Lightning events	*Never*	*Already*
Equipment sensitivity	*Low*	*High*
Equipment costs	*Low*	*High*
Downtime costs	*Low or acceptable*	*Expensive or unacceptable*

The level of recommendation (from «no recommendation» to «highly recommended») of using surge protectors increase with the number of parameters classified as «high risk» on the table. More detailed risk analysis are available in the IEC 62305-2 and IEC61643-22 standards.

SURGE PROTECTION PARAMETERS

In choosing surge protection for your installation, bear the following in mind:

- The type of line: There is an appropriate level of protection and protection diagram for each type of line.
- The site configuration: Number of lines to be protected.
- The requested type of installation: The CITEL line provides the following possibilities:
  - Installation in wall-mounted box, plug mounting, on distribution frame
  - various types of connection (screw, spring contact, connectors...)
- Maintenance features: Some surge protectors are:
  - equipped with pluggable modules (DLA).
  - equipped with failure indicators (DLAS1-DLATS1)

INSTALLATION

To be effective, surge protectors must be installed in accordance with the following principles:

- The earth point of the surge protector and of the protected equipment must be interconnected.
- The protection is installed on the network entrance, to divert impulse currents as fast as possible.
- The protected equipment must be nearby (protector/equipment distance less than 10 m long). If this rule cannot be followed, «secondary» protection must be installed near the equipment (coordinated surge protection).
- The grounding conductor (between the earth output of the SPD and the installation bonding circuit) must be as short as possible (less than 0.50 m) and have a minimum cross-section of 1 mm².
- The earth resistance must comply with the standards in force (no special earthing requested).
- Protected and unprotected cables must be kept well apart to limit coupling.

MAINTENANCE

CITEL data line surge protectors require usually no maintenance or replacement. They are designed to withstand repeated and heavy impulse currents without damage.
Nevertheless a controlled fail-safe mode (short circuit to earth) is planned in case of surges exceeding the parameters of the surge protectors:

Protective short-circuit occurs in the following cases:

- Prolonged contact with a AC power line (AC overstress test in accordance with EN 61643-21)
- Exceptionally violent «lightning» strike (impulse overstress test in accordance with EN 61643-21).

In these cases, the surge protector definitively short-circuits, which indicates to the user the functional destruction through a transmission cut, while protecting the terminal equipment (Mode 2 default in accordance with EN 61643-21). The specific versions DLAS1 or DLATS1 provide a different failure mode: opening the line and switching an indicator in the front face of SPD or closing a switch for remote signalling (mode 2 default).
In all these cases, to reactive the line, the user must replace the surge protector or replace the removable module for pluggable versions.
The basic parameters of the surge protector for datalines could be controlled with dedicated testers.

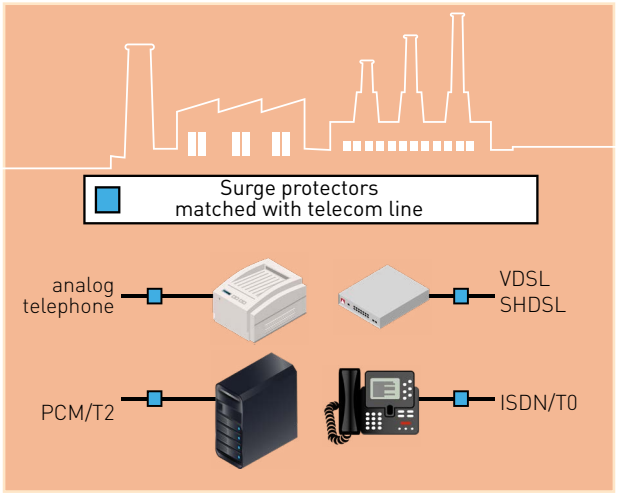
SPECIAL CONDITION: LIGHTNING ROD

If the installation to be protected is equipped with LPS (lightning rod), the surge protectors for telecom or datalines, connected on external lines must be able to conduct 10/350 µs surge current with a rating up to 2.5 kA minimum (D1 category test in IEC 61643-21 standard).

TELECOM SURGE PROTECTORS

PROTECTING TELECOMMUNICATION EQUIPMENT

Telecom devices (PBX, Modems, Terminals..) are especially exposed to lightning surges. CITEL offers a range of surge protectors dedicated to the protecting of these types of telecommunication networks:



For each type of telecom line, an adapted protection scheme must be used:

Lines	Voltage		Diagram
	Nominal	Residual	
Switched telephone /ADSL	170 V	210 V	Standard protection
ISDN, T0 primary access	48 V	70 V	Enhanced protection
ISDN, T2 primary access	6 V	25 V	Enhanced Protection Low capacitance
VDSL, SHDSL	170 V	210 V	Enhanced protection Low capacitance

The decision whether or not to use surge protection would be determined by taking a simplified risk assessment (see «Risk analysis» paragraph), or by detailed risk assessment (as the one included in IEC 61643-22 standard), or by specific installation conditions as:

Conditions	Recommendation
External telecom lines	Systematic protection
Lines downstream PBX	Protection in long or inter-building lines
Existing AC surge protector	Systematic protection

CITEL RANGE

Surge protectors for telecom networks are designed to fit into existing installations. So, CITEL surge protectors are available with several mechanical configurations and different mounting options:

- Connection boxes for Wall Mounting
- RJ11/RJ45 connection modules
- DIN rail mounting enclosure

B180 - B280 - B480 	Wall mounting Screw connection 1 to 4 pairs
MJ6 - MJ8 	RJ11 or RJ45 1 to 4 pairs
DLC - DLA - DLU 	DIN mounting Screw or spring connection 1 or 2 pairs Pluggable (option)

DATA LINE SURGE PROTECTORS

PROTECTING INDUSTRIAL NETWORKS

Industrial installations, businesses or smart buildings are packed with an increasing quantity of control equipment, measurement, control and supervisory equipment.
These systems are built with controller cards, probes, sensors and various sensitive electronic components: downtime on the operation on this equipment can be extremely costly.

Thus, it is increasingly vital to guarantee a relevant level of reliability to these systems: this can be obtained by installing data-line surge protection.

Equipment to be protected

Industrial or business installations are equipped with many different types of sensitive terminals, which must be protected against transient voltages, such as:

- Industrial process equipment
- SCADA systems (Supervisory Control And Data Acquisition)
- Transmission systems
- I/O cards
- Interfaces, converters
- Probes
- Actuators
- Access control system
- Fire detection system, Displays

Many data transmissions (or fieldbus) exist on the market. The table beside provides some examples of relevant CITEL surge protector model (DLA series: pluggable module, or DLC series: monobloc & compact module) in relation to the type of data transmission.

Network	Wiring	DLC	DLA*
4-20 mA	1 pair	DLC-24D3	DLA-24D3
Profibus-FMS	1 pair+Shield	DLC-12D3	DLA-12D3
Profibus-PA	1 pair+Shield	DLC-48D3	DLA-48D3

RS232	4 wires	-	DLA2-12D3

DATA LINE SURGE PROTECTORS

CITEL RANGE

CITEL surge protectors for industrial data networks are designed to fit on symmetrical DIN rail.
Due to multiple possible configurations requested, CITEL offers a large range of solutions, the surge protectors are available in various configurations:

- Number of protected wires: 1 to 2 pairs.
- Screw or spring contact wiring
- Transmission and protection of the shield wire
- Compactness (DLC)
- Plug-in modules: Fixed version (DLU, DLU2) or Version with removable module (DLA, DLA2) to ease the maintenance process.
- Signalling or remote signaling feature in case of end of life (DLAS1, DLATS1)
- Higher load current

The summary table below informs the different features related to the different models of dataline SPDs for DIN mounting.

DLA - DLA2 - DLAS1 - DLATS1 	Pluggable 1 or 2 pairs Screw/spring connection Imax 20 kA
DLU - DLU2 	Monobloc 1 or 2 pairs Screw connection Imax 20 kA
DLC 	Compact Monobloc 1 pair Spring connection Imax 10 kA

CITEL range	Line configuration	Pluggable Module	Line transmission when plug-out	Default mode (following IEC61643-21)	Shield management	Wire Connection	Default Signalling	Default Remote Signalling	Width	Imax	Max Load current

COMPUTER NETWORK SURGE PROTECTORS

COMPUTER NETWORK SURGE PROTECTORS

PROTECTING DATA-PROCESSING NETWORKS

For industrial sites or business buildings integrating Local Area Networks (LAN), any single issue at one of these systems will create consequences, more or less, to the safety and productivity of the entire system.
It is now more and more crucial to reinforce the level of reliability for these systems: this can be achieved by using a proper surge protection strategy for these sensitive networks.
As is the case in telecom or industrial networks, the installation of surge protectors on data-processing networks is necessary, especially in the following cases:

- Inter-building networks
- Wide networks
- High Electromagnetic disturbance density
- Heavy Lightning exposure

As for the other types of transmission lines, CITEL surge protectors for LANs are based on an association of 3-pole gas tubes and fast clamping diodes to ensure efficiency on lightning surges. In addition, two additional parameters need to be taken into account: the voltage level of the application and the very high data transmission speed. CITEL surge protectors for data-processing networks are designed for both of these requirements.

Performances

Ethernet network surge protectors are designed for computer networks with very fast data transfer speed up to 10 Gbit/s for the Ethernet Category 6A networks. In order to cover the many various types of networking applications, CITEL offers a complete range of surge protectors adapted to these Ethernet and PoE networks.

Standard

Surge protectors for LAN are in compliance with IEC 61643-21.

CITEL RANGE FOR ETHERNET @ POE

CITEL Surge protector for LAN can be adapted to the different configurations. They are equipped with the network connection (RJ45) and available either in an individual box for the protection of an isolated terminal, or in a 19'' Rack version for multi-line protection at hub or server level.

Surge Protectors for terminal equipment

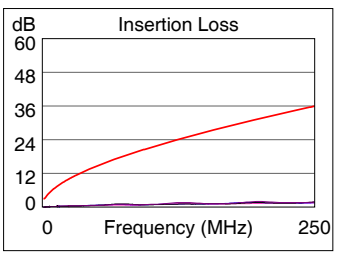
CITEL offers several configurations depending on the types of network and the performance protection required:

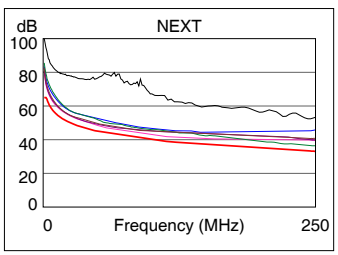
The MJ8-C6A are dedicated all STP (shielded cable) Ethernet networks up to the Category 6A. Their GDT/Diodes circuit gives them the discharge capacity necessary for the protection of inter-building connections.

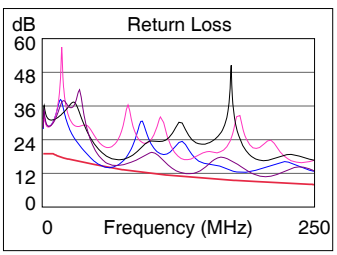
The MJ8-POE-C6A are designed to protect indoor equipment connected to PoE++ networks, up to Category 6 A.

The CxMJ8-POE-C6A are designed to protect outdoor equipment connected to PoE++ networks, up to Category 6 A.

TRANSMISSION CURVES (MJ8-C6A)







Multi-port surge protectors 19'' Rack format

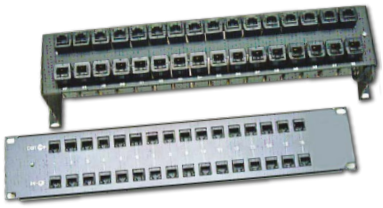
CITEL offers several configurations depending on the types of network and the protection performance required:

PL range

Available in 24 and 12 ports. Category 6 compatible. Shielded RJ45 input/output. STP cabling. GDT/diodes diagram.

RAK range

Available in 32 and 16 ports. Category 6, PoE and coaxial BNC connection versions. Input/output by connectors on front. UTP cabling.



PCH range

Available in 48, 24 and 12 ports. Category 6, PoE and Telecom versions. Connection by self-stripping connectors/terminal. UTP cabling.

INSTALLATION

The surge protector for IT networks must be installed while respecting the following principles:

- SPDs must be installed on the both sides of the transmission line (e.g. server side and terminal equipment side)
- The surge protector and the protected equipment must be interconnected with the bonding network of the installation.
- The earthing conductor (between the earth output of the SPD and the bonding circuit of the installation) must be as short as possible (less than 0.50 m).
- The AC power supply of the equipment must also be surge protected.

PROTECTING VIDEO DATA TRANSMISSION

Video transmission lines (survey cameras) are regularly subjected to transient surges due to the nature of their distributed application. In order to insure the integrity of these installations, the application of dedicated SPDs at the equipment level (cameras) as well as at the server is absolutely necessary.

CITEL RANGE

The CITEL surge protectors for video-transmission are adapted to different configurations:

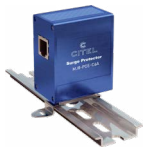
Video via coaxial cable: a surge protector is installed on the coaxial connection (CXP and CNP ranges).
The power supply as well as the control links must also be protected : The MSP-VM-2P surge protectors bring together all the protection devices in one single unit.

MSP-VM-2P

CNP

Video over IP: a MJ8-C6A surge protector must be installed on the IP connection.
The AC power supply of the terminal equipment must also be protected :The MSP-VM/R surge protector brings together all the protection devices in one single unit.

MSP-VM/R



MJ8-POE-C6A

Video over PoE: a PoE compatible surge protector (MJ8-POE-C6A) must be installed on the terminal equipment. In the case of outdoor installation, the CRMJ8-POE-C6A or CWMJ8-POE-CA6 is necessary.

RAK-E-C6

RAK16-BNC

RAK SERIES

- 19" Rack mounted or Stand off (SO version)
- 16 or 32 ports
- In/out front: RJ45, BNC
- Available for Telecom and UTP Ethernet networks
- Possible maintenance per line
- Secondary protection
- IEC 61643-21 and UL497B compliance

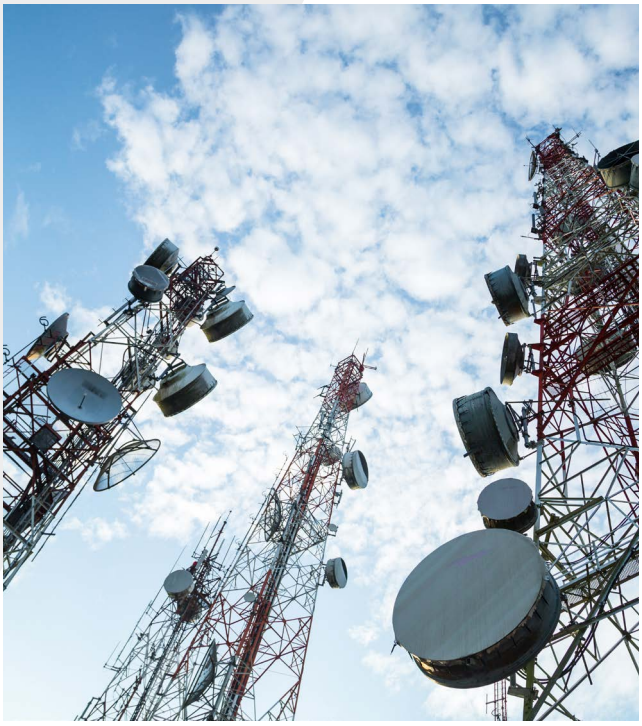
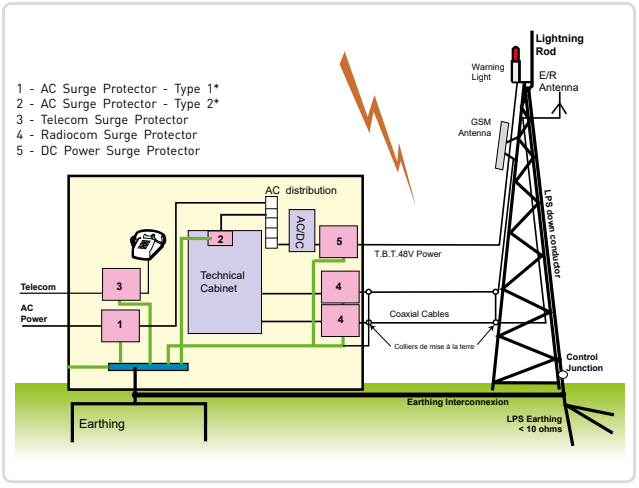
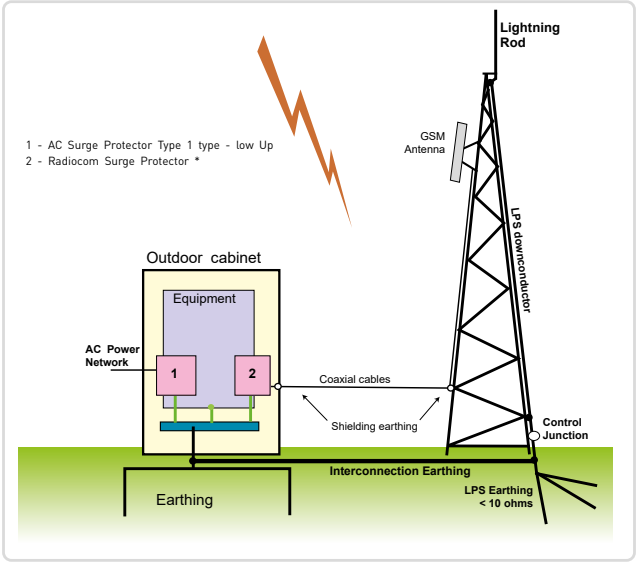
CITEL

COAXIAL RF SURGE PROTECTORS

RF SURGE PROTECTION OR RF COAXIAL SPD







* Type referring to IEC standards

PROTECTION OF RADIO COMMUNICATION EQUIPMENT

Radio communication equipment deployed in fixed, nomadic or mobile applications are especially vulnerable to lightning strikes because of their application in exposed areas. The most common disruption to service continuity results from transient surges originating from direct lightning strikes to the antenna pole, surrounding ground system or induced onto connections between these two areas.

Radio equipment utilized in CDMA, GSM/UMTS, WiMAX or TETRA base stations, must consider this risk in order to insure uninterrupted service. CITEL offers three specific surge protection technologies for Radio Frequency (RF) communication lines that are individually suited for the different operational requirements of each system (Filter, GDT and quarter wave).

RF SURGE PROTECTION TECHNOLOGY

P8AX series (Gas Tube Protection)

The gas discharge tube (GDT) is the only surge protection component usable on very high frequency transmission (several GHz) due to its very low capacitance. In a coaxial surge protector, the GDT is connected in parallel between the central conductor and the external shield. When its sparkover voltage is reached, during an overvoltage event, the line is briefly shorted (arc voltage). The sparkover voltage depends on the rise front of the overvoltage. The higher the dV/dt of the overvoltage, the higher the sparkover voltage of the surge protector is.
When the overvoltage disappears, the gas discharge tube returns to its original condition of high isolation and is ready to operate again.
The gas tube is removable, making maintenance rapid in the end-of-life scenario (short-circuit).

The greatest advantage of this technology is its very wide bandwidth: from DC (so, compatible with DC voltage injection) to several GHz.

Main characteristics:

- Insertion losses < 0,2 dB
- VSWR < 1,2
- Imax : 20 kA (8/20µs)
- Frequency range from DC to 7 GHz
- Connectors : 7/16, 4.3-10, N, TNC, BNC, SMA, F, UHF
- Waterproof IP65

Main characteristics VG option:

- Imax : 6 kA (8/20µs)
- Connector : 4.3-10, N, F
- Prevents the short-circuit of the transmitter (output) and the receiver (input) during a disturbance

CNP/CXP series (GDT protection) and CXP-DCB series (DC Blocked Protection)

CXP protectors are based on GDT to provide high discharge current capability without destruction. These type of products allows for installation in ungrounded systems. In these cases, the CXP isolates the shield from the earth ground and is typically found in applications including wireless radio terminals and TV monitors (antenna, cable or satellite).

CXP-DBC version is a relevant hybrid association between a filter stage and a gas tube : this configuration has the advantage of reducing low frequency disturbances (DC and lightning voltages) while providing a high discharge current capability.

Main characteristics (CXP):

- » isolated ground through GDT
- » Insertion losses < 0.5 dB
- » VSWR < 1.3
- » Imax : 20 kA (8/20µs)
- » Frequency range from DC to 1000 MHz
- » Connectors : N, BNC, SE, F...

Main characteristics (CXP-DBC):

- » "DC Block" feature
- » Insertion losses < 1 dB
- » VSWR < 1.2
- » Imax : 20 kA (8/20µs)
- » Frequency range from 125 MHz to 1000 MHz
- » Connectors : N

PRC series (Quarter Wave Protection)

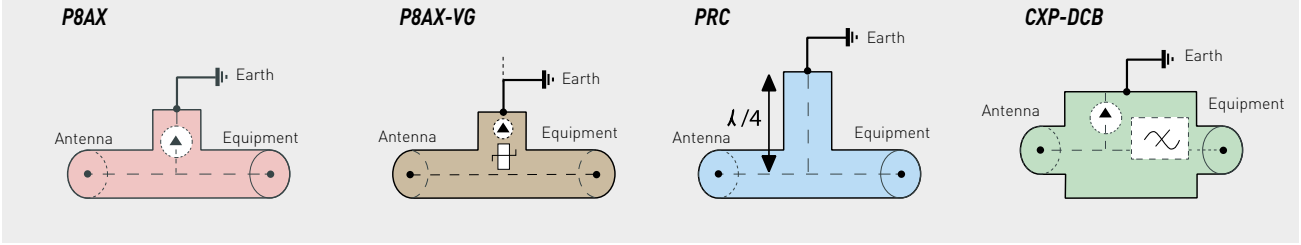
Quarter Wave DC Blocked Protection is an active band pass filter. It has no active components. Rather the body and corresponding stub are tuned to one quarter of the desired wave length. This allows only specific frequency bands to pass through the unit. Since lightning operates only on a very small spectrum, from a few hundred kHz to a few MHz, it and all other frequency's are short-circuited to ground.
The filter may be selective (narrow band or wide-band), according to the calculation of various mechanical elements.

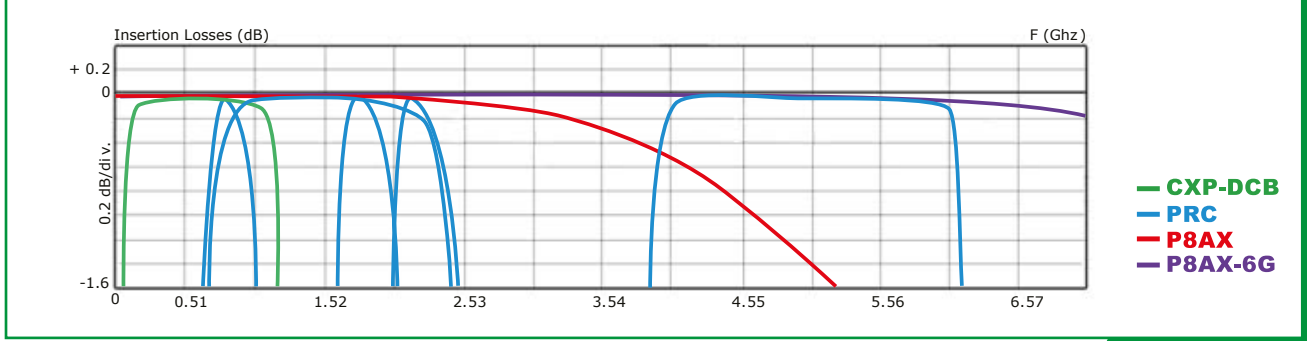
The PRC technology can be selected with very narrow band or wide band depending on the application. Surge current withstand is the depending on connector type. Typically, a 7/16 Din connector can handle 100kA 8/20µs while an N-type connector can handle up to 50kA 8/20µs.
AC/DC power injection is not possible with this technology typical application is the protection of radio lines that do not have a source voltage

Main characteristics :

- » Insertion losses < 0.2 dB
- » VSWR < 1.2
- » Broadband and narrowband units available
- » Frequency range:
  - 690-2700 MHz
  - 800-2200 MHz
  - 400-500 MHz
  - 870-950 MHz
  - 1700-1950 MHz
  - 1800-2400 MHz
  - 4800-6000 MHz
- » Best PIM performance: less than 160 dBc with 4.3-10 connector
- » Imax : up to 100 kA (8/20µs)
- » Connectors : 7/16, N, BNC, TNC, 7/8 cable

RF SURGE PROTECTORS DIAGRAMS





RF SURGE PROTECTION or RF COAXIAL SPD

COAXIAL SPD SPECIFIC PARAMETERS

RF transmission parameters

Coaxial protectors are intended to pass through a desired RF signal with minimum loss or disturbance. When RF energy enters a protector, the energy is, in some combination, passed through, reflected back, and dissipated within the device. The fundamental RF performance parameters of a coaxial protector are:

- Operation frequency range
- Insertion Loss : the loss in load power due to the insertion of the coaxial protector, measured in decibels (dB)
- Return Loss : part of signal which is lost due to reflection of power at a line discontinuity or mismatched coaxial protector, in decibels (dB)
- VSWR : Voltage standing Wave Ratio – ratio of Umax/Umin on a RF transmission line
- PIM (Passive Intermodulation) : non-linear characteristics of coaxial protectors cause undesirable signals by modulation effects in the case of several carriers being transmitted.

Connectors Surge current parameters

- General parameter from standard (In, Imax, Iimp refer to standards)
- Let-Through Energy :
  Energy through the surge protector when a standardized impulse is applied to the input. In most cases the input is a combination wave 4kV 1.2/50µs – 2kA 8/20µs. The output of the protector is burdened by 50 Ω, and the resulting waveform is measured. The let-though energy, in Joules, is calculated from the peak voltage/current and integrated pulse width across the load.

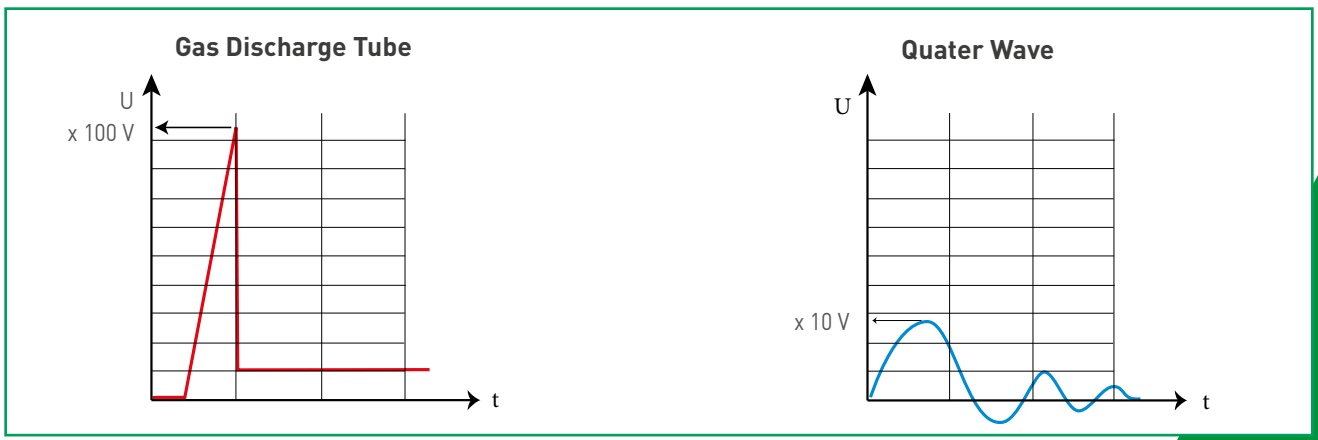
SPD TECHNOLOGIES COMPARISON

Table below allows comparison between the 3 technologies of RF coaxial surge protectors, in order to select the right solution regarding the application and the requirements.

Technology	Gas Discharge Tube (GDT)	DC Block	Quarter wave (1/4)
CITEL series	**P8AX**	**CXP-DCB**	**PRC**
			
Principle	Switching	Switching + Filter	1/4 wave filter
Residual voltage (under standardized test condition: 1kV/µs surge voltage and/or surge current (8/20µs))	Depending on version, it can be from 600V to 2400V for typically 200 ns and then 10V during surge current flowing time.	Less than 600V for typically 200 ns and then 0V during surge current flowing time.	< 20 V during all surge duration.
Frequency range	DC up to 7 GHz (dependent on the coaxial connector and the impedance)	125-1000 MHz	Broadband and narrow band (GSM, DCS1800, PCS, DECT, GPS....) up to 5800 MHz
DC/AC power injection	Possible	Blocked	Not compatible
Typical 8/20µs surge current capability	20 kA	20 kA	Depending on the connector: 100kA for the 7/16, 50kA for the N
Typical 10/350µs lightning current capability	2.5 kA	2.5 kA	Function of the connector : 25kA to 50kA
Typical let through energy (on 50 Ohms load for 4kv/2kA combined surge)	300µJ	300µJ	5µJ
Maintenance	Possible to replace the GDT (but not recommended)	None	None
End of life detection	RF line shorted	RF shorted	No end of life excepted due to environmental stress
Connectors	N, BNC, TNC, UHF, SMA, 7/16, 4.3-10 option VG : 4.3-10, N, F	N	7/16, N, TNC, 4.3-10....



RF SURGE PROTECTION or RF COAXIAL SPD

TYPICAL RADIO FREQUENCY BANDS

LF : Low Frequency	30-300 kHz
MF : Medium Frequency	300-3000 kHz
HF : High Frequency	3-30 MHz
VHF : Very High Frequency	30-300 MHz
UHF : Ultra High Frequency	300-3000 MHz
SHF : Super High Frequency	3-30 GHz

A FEW MICROWAVE APPLICATIONS

Tetra, Tetrapol	380-512 MHz
GSM850	824-894 MHz
Tetra	870-925 MHz
GSM 900	880-960 MHz
GPS	1575 MHz
GSM 1800	1710-1785 MHz
GSM 1900	1850-1990 MHz
DECT	1880-1900 MHz
WCDMA/TD-SCDMA	1850-2025 MHz
UMTS (IMT-2000)	1885-2200 MHZ
WLL (WiMax)	2400-5825 MHz

INSTALLATION, LOCATION OF THE SPD

The efficiency of coaxial protectors is highly dependent on proper installation, in particular their connection to the earthing network of the installation.
The following installations rules must be strictly observed to ensure the efficiency:

» Equipotential bonding network: all the bonding conductors of the installation must be interconnected and connected to the installation earthing network.

» Optimized connection of the protector to the bonding network: to reduce the residual voltages during lightning discharge currents, the connection of the protector to the bonding network must be as short as possible (less than 50 cm) and has a proper cross section (at least 4 mm²).

The «feedthrough mounting» versions perfectly meet all these requirements.

Warning: Carefully remove all paintings or insulating coatings to ensure good contact..

» Location of the protectors: they should preferably be placed at the entrance of the installation (to limit the penetration of lightning currents) and also near sensitive equipment (to enhance protection).

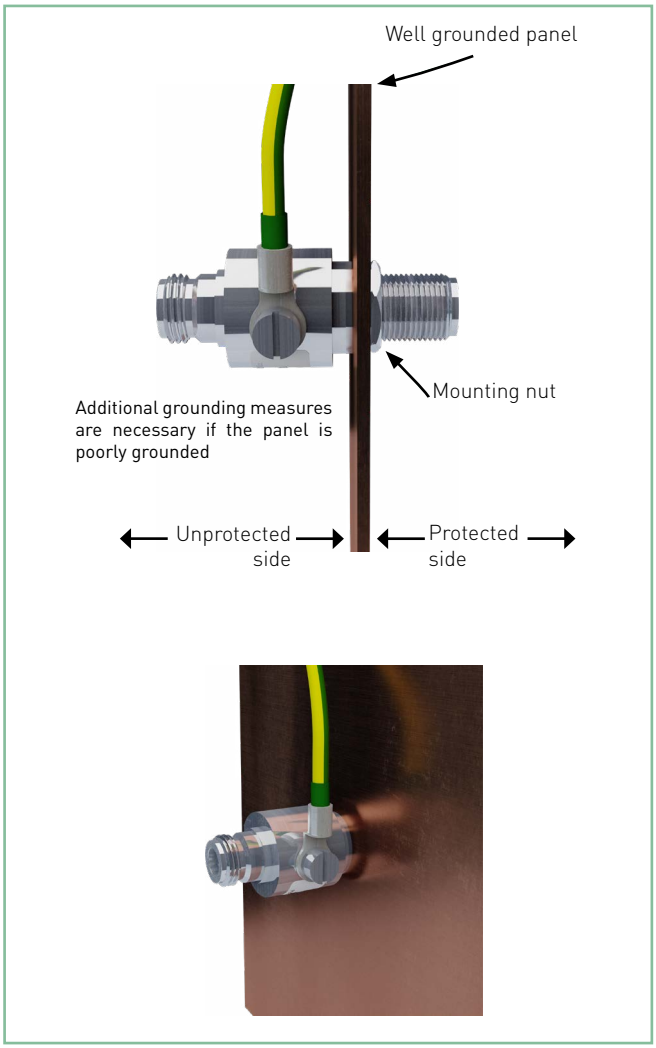
MOUNTING

The proper mounting of a coaxial surge protector is largely dependent on its connection to a low impedance grounding system. The following rules must be strictly observed:
Equipotential Grounding System: All the bonding conductors of the installation must be interconnected to each other and connected back to the grounding system.
Low Impedance Connection: The coaxial surge protector needs to have a low resistance connection to the Ground System.
Note: Depending on models, CITEL Coaxial SPD's family is suitable to be mounted outdoor and can be immersed as soon as the connection to the cable is realized to be immerse as well.

Feedthrough mounting

Direct mounting of the surge protector on the grounded frame at the installation entrance (or on specific bracket see p. 177) :

» Perfect connection to the bonding network
» Best location (conduction of the surge currents at the entrance of the installation)
» Good mechanical withstand.



Note: Unprotected side and Protected side concept is a recommendation to keep the box concept principle but surge protection is bidirectional

Alternative mounting

Connection to the bonding network by wire (4 mm² minimum and shortest length possible).

STANDARDS

Various standards address Coaxial surge protection . CITEL SPD are designed to be compliant with the following:

IEC 61643-21 : Low voltage surge protective devices – Part 21: Surge protective devices connected to telecommunications and signaling networks – Performance requirements and testing methods
EN 61643-21: Low voltage surge protective devices – Part 21: Surge protective devices connected to telecommunications and signaling networks – Performance requirements and testing methods

SPD SELECTION

Peak power and connectors

Peak power is the maximum transmitted power that the SPD can handle without damage or unwanted action.
The connector is mainly set by the installation. The characteristic Impedance of the SPD is often linked to a specific type of connector but it may happen that a connector type exists with 2 different impedances (50 ohms and 75 ohms are possible with BNC connector).

For PRC range, the admissible peak power is depending on the connector. See declared values in dedicated datasheet.
For P8AX, CXC, CXP ranges, the admissible peak power is linked

- to the nominal spark over voltage: of the selected GDT,
- to the VSWR,
- to the possible injected ac/dc power,
- to the Impedance and
- to the connector type (not big impact for P8AX).

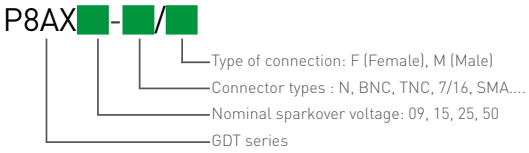
Following tables are showing how to select both PA8X spark over voltage of the GDT for 50 ohms with no injected ac/dc power and Connector selection. For CXP and CXC ranges, the selection principal is similar to P8AX range, and details are provided on various datasheets in the following pages.

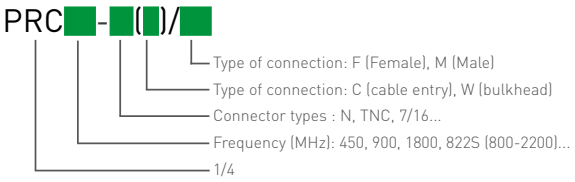
CITEL model	Nominal sparkover voltage	Max. peak power with	
		VSWR<1.2	VSWR <1.5
P8AX09	90 V	25 W	24 W
P8AX15	150 V	70 W	67 W
P8AX25	250 V	190 W	188 W
P8AX50	500 V	780 W	762 W

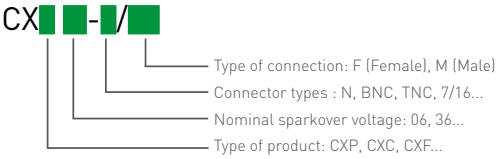
CITEL model	Connectors
P8AX-716	7/16
P8AX-4310	4.3-10
P8AX -N	N
P8AX - T	TNC
P8AX -B	BNC
P8AX -SMA	SMA
P8AX -F	F
P8AX -U	UHF

When ac/dc power is injected, special care must be applied. As an example, if 48V dc power is superimposed with RF signal a P8AX25 is limited to 114W for VSWR ⩽ 1,2. Consult our experts for further information.

REFERENCE SYSTEM







RF SURGE PROTECTION or RF COAXIAL SPD

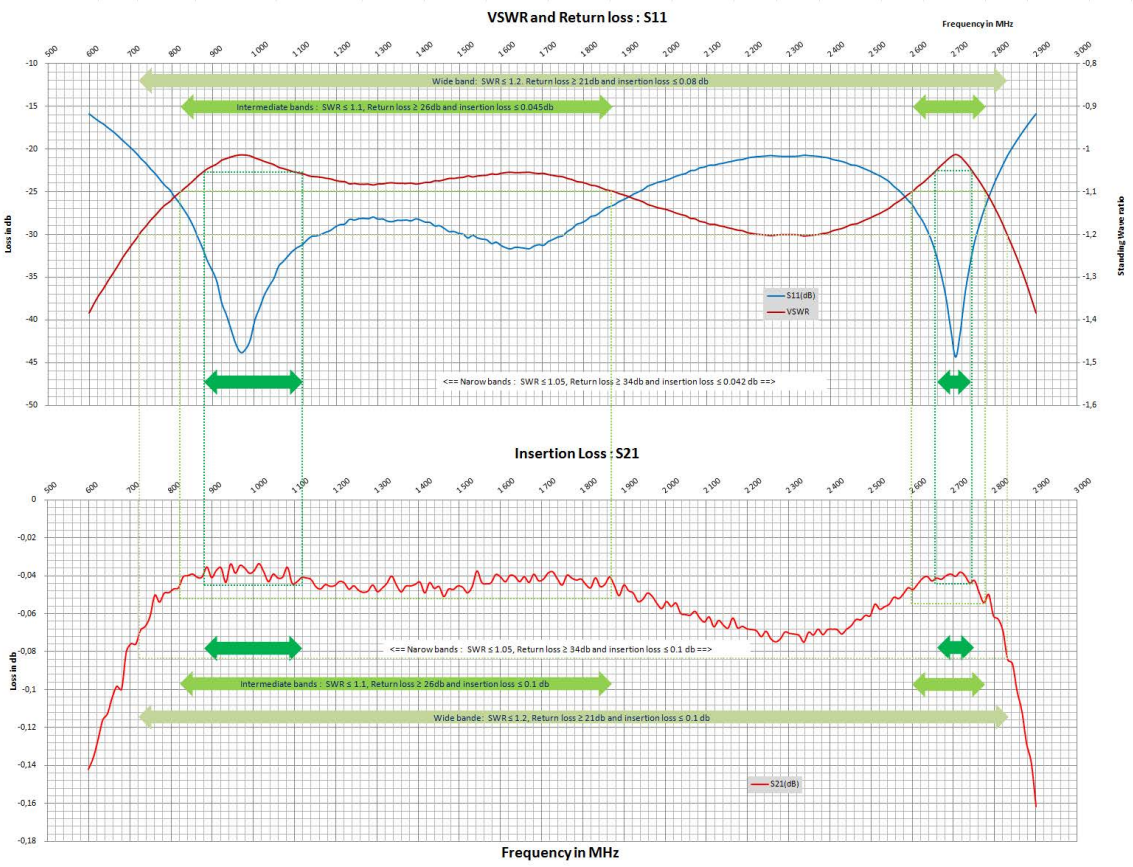
EXAMPLE FOR SPECIFIC REQUIREMENT USING A PRC827-N/MF

Main features description of the Quarter-Wave Surge Protector used for the example

- » Maintenance Free Design
- » Low Insertion Loss
- » Several Wide to Narrow Band Applications
- » Imax > 50kA, Peak power = 1,5kW, Z = 50Ω
- » IP66 Classification
- » DC Block (Short Circuit)

To select the proper RF protection, the main point is to know exactly what will be the frequency of use and the minimum transmission characteristic that the system is able to accept for proper communication. The full system must then be known as each single element of the system is willing to disturb or attenuate the RF signal. Connectors, cable and any other components or equipment that is comprised in this system must be considered. In general a VSWR lower than 1.2 is more than acceptable for a system to work properly this is why the wide band for single RF equipment is limited by the frequencies that are corresponding to this ratio. In some extreme case, the specific need is to get lower VSWR for the full system. It is mandatory to optimize each single equipment because each losses is simply cumulated along the transmission line (Coaxial cable equipped with various equipment such as SPDs). For this example, the hereunder plots made on our PRC827-N/MF, are showing transmission characteristics depending on frequencies that are better or even much better than general declared values.
In such specific needs, the Surge protection must be selected in regard to the working frequency band.
Note: in general all RF characteristics for a device are linked and vary in the same way depending on the frequency.

In our example, if the requested working frequency band is 2.7 GHz to 2.72 GHz, the selected SPD is presenting exceptional RF characteristics in this frequency range (VSWR<1,05) even if general features state that VSWR is between 1 and 1,2 from 0,8 GHz to 2,8GHz.



Another presentation format is shown in the following table.

Frequency band		Wide	Intermediate low	Intermediate high	Narrow low	Narrow high
	(MHz)	720-2830	820-1970	2600-2780	880-1120	2655-2745
VSWR	-	< 1.2	< 1.1		< 1.05	
Return loss	(dB)	> 21	> 26		> 34	
Insertion loss	(dB)	< 0.09	< 0.045		< 0.042	

In general wide band characteristics provided are sufficient for good selection of SPDs and for general application.
Specific characteristics are available on request for specific frequencies.

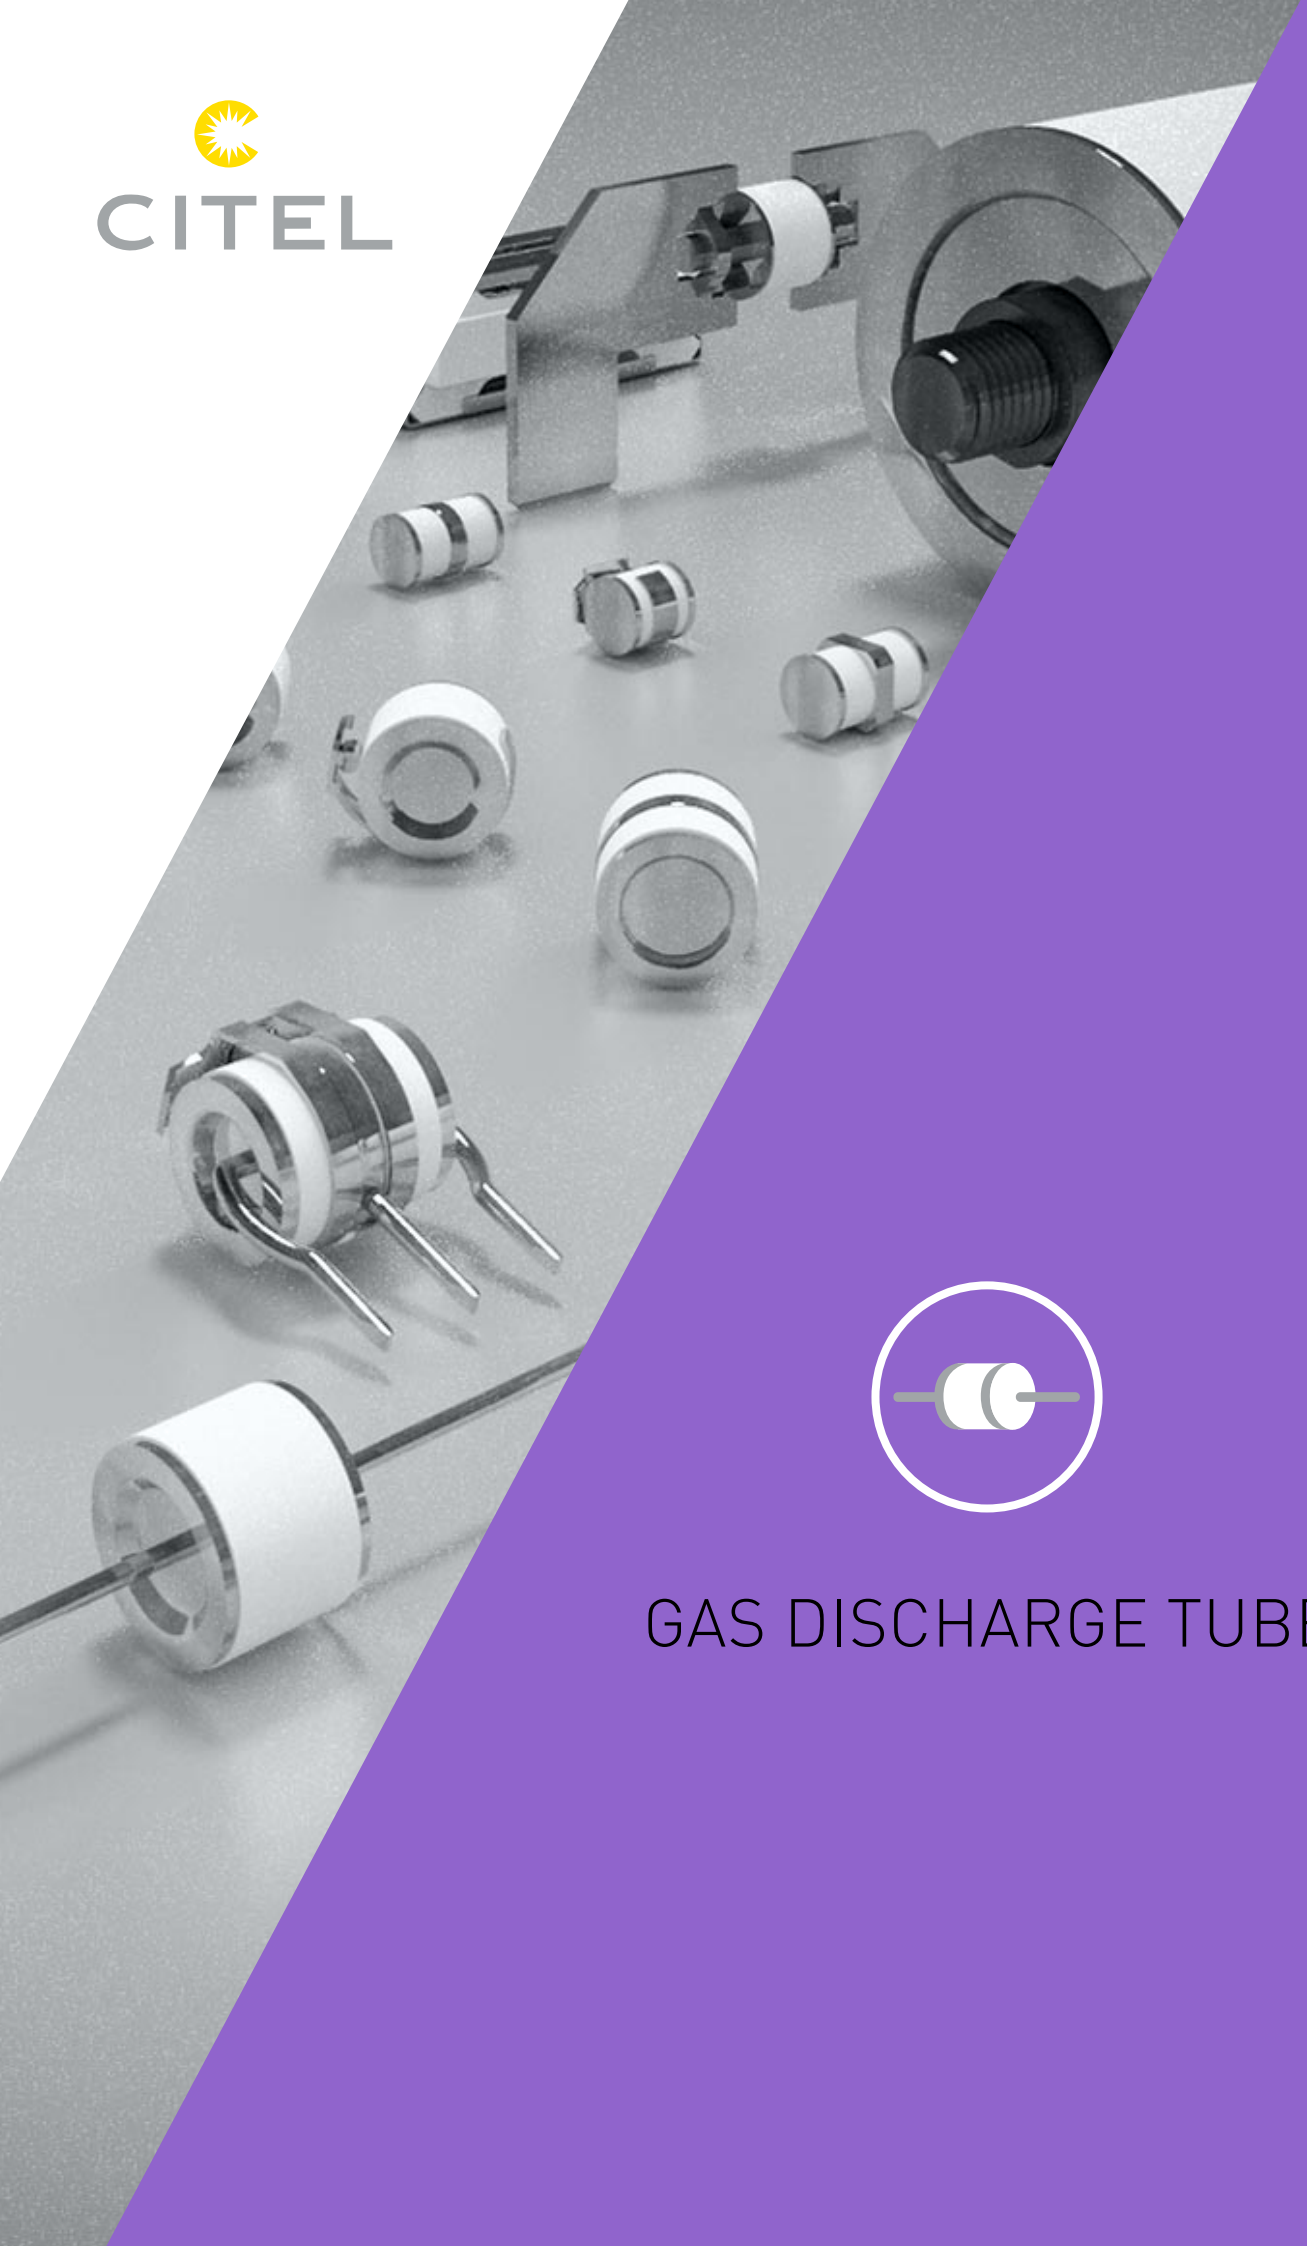
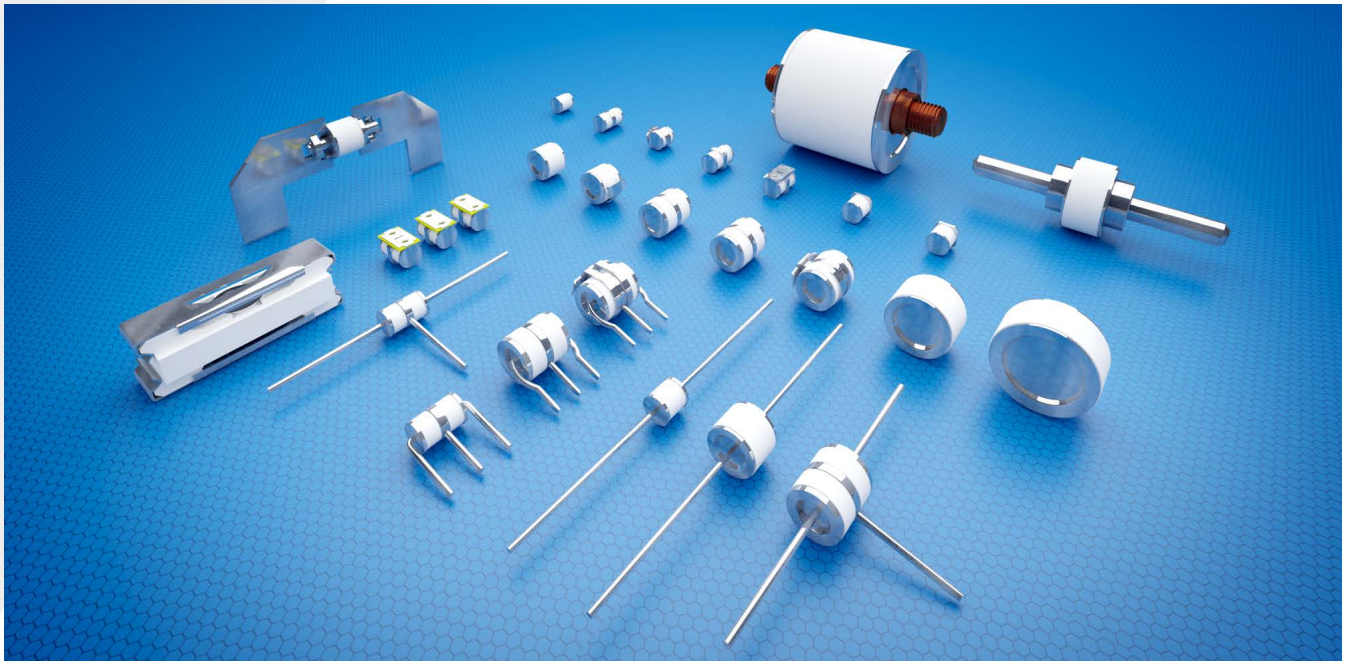
CITEL

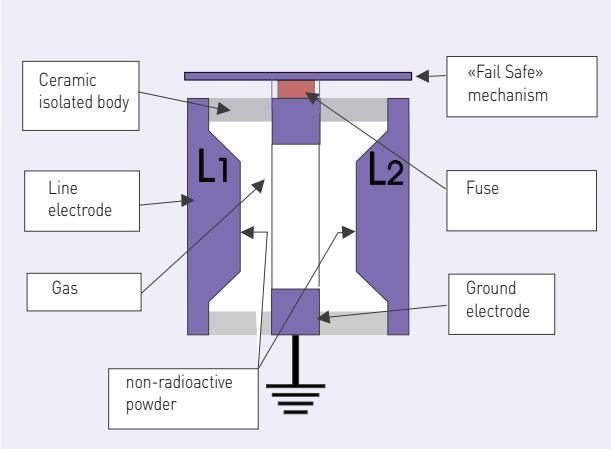


GAS DISCHARGE TUBE

GAS DISCHARGE TUBES



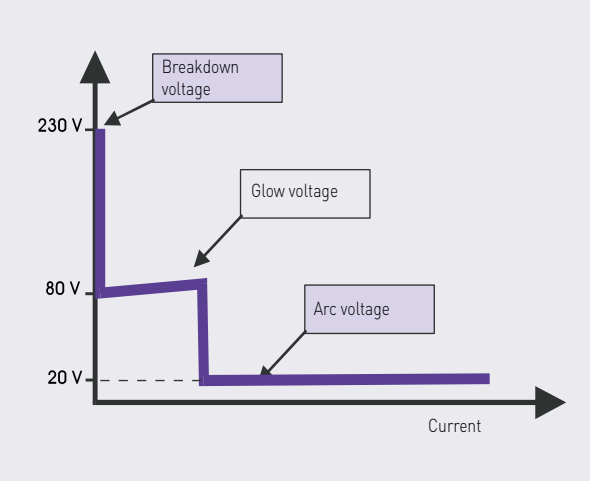
The Gaz Discharge Tubes (or GDT) are passive components made of two or three electrodes in an enclosure filled with a (non-radioactive) rare gas at a controlled pressure.
The enclosure is a ceramic tube with its ends closed off by metal caps that also serve as electrodes.
Their main use is to protect telecommunications lines, but other uses are possible.



OPERATION

The gas discharge tube may be regarded as a sort of very fast switch having conductance properties that change very rapidly, when breakdown occurs, from open-circuit to quasi-short circuit (arc voltage about 20V). There are accordingly four operating domains in the behavior of a gas discharge tube:

- **Non-operating domain**, characterized by practically infinite insulation resistance;
- **Glow domain** : At breakdown, the conductance increases suddenly; if the current drained off by the gas tube is less than about 0.5A (this is a rough value that differs according to the type of component), the glow voltage across the terminals will be in the 80-100V range;
- **Arc regime** : as the current increases, the gas discharge tube shifts from the glow voltage to the arc voltage (20V). It is in this domain that the gas discharge tube is most effective, because the current discharged can reach several thousand amperes without the arc voltage across its terminals increasing.
- **Extinction** : At a bias voltage roughly equal to the glow voltage, the gas tube recovers its initial insulating properties.



Operating regimes

ELECTRICAL CHARACTERISTICS

The main electrical characteristics defining a gas discharge tube are :

- DC sparkover voltage (Volts)
- Impulse sparkover voltage (Volts)
- Discharge current capacity (kA)
- Insulation resistance (Gohms)
- Capacitance (pF).

DC sparkover voltage

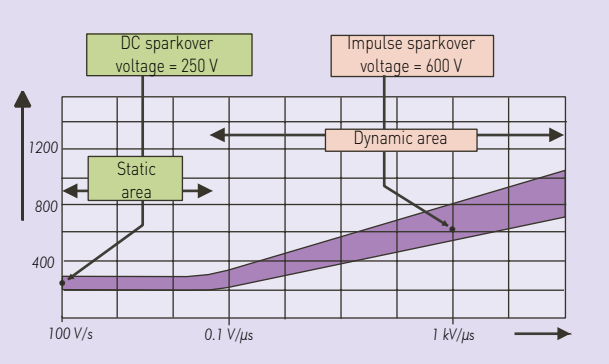
This is the main characteristic defining the gas discharge tube.
It is the voltage at which breakdown will occur between the electrodes when a slowly increasing voltage (dV/dt = 100 V/s) is applied to the component; it depends on the electrode spacing, the pressure, and the properties of the gas mixture and of the emissive substance.

Range of DC sparkover voltages available:

- minimum 75V
- average 230V
- high voltage 500V
- very high voltage 1000 to 3000V

The tolerance on the breakdown voltage is generally ± 20%.

DC and Impulse sparkover voltages



Discharge current

This depends on the properties of the gas, the volume, and the material and treatment of the electrodes. It is the major characteristic of the GDT and the one that distinguishes it from other protection devices (Varistor, Zener diode, etc.): 5 to 20kA with an 8/20µs impulse for the standard components. This is the value the device can withstand repeatedly (say for ten impulses) without destruction or alteration of its basic specifications.

Impulse sparkover voltage

Sparkover voltage in the presence of a steep rise front (dV/dt = 1kV/µs): the impulse sparkover voltage increases with increasing dV/dt.

Insulation resistance and capacitance

These characteristics make the gas discharge tube practically «invisible» in a line in a steady-state context: insulation resistance very high (>10 Gohm), capacitance very low (<1 pF).

3-ELECTRODE CONFIGURATION

Protecting a two-wire line (for example a telephone pair) with two 2-electrode gas discharge tubes (connected between the wires and ground) may cause the following problem:
The line is subjected to an overvoltage in common mode; because of the dispersion of the sparkover voltages (± 20%), one of the gas discharge tubes sparks over a very short time before the other (a few microseconds); the wire that has sparked over is therefore grounded (neglecting the arc voltages), turning the common-mode overvoltage into a differential-mode overvoltage, very dangerous for the terminal equipment. This risk disappears when the second gas discharge tube arcs over (a few microseconds later).
3-electrode gas tube geometry eliminates this drawback: the sparkover of one pole causes a «general» breakdown of the device almost instantaneously (a few nanoseconds) because there is only one gas-filled enclosure.

END OF LIFE

Gas discharge tubes are designed to withstand several impulses without destruction or loss of the initial characteristics (typical impulse tests: 10 times 5 kA impulses of each polarity).
On the other hand, a sustained strong current (e.g. 10 A rms for 15 seconds, simulating the fall of a AC power line onto a telecommunication line) will put the device out of service definitively.
If a fail-safe end of life is desired (i.e. a short-circuit that will report the fault to the user when the line fault is detected), gas discharge tubes with the fail-safe feature (external short-circuit) should be chosen.

STANDARDS

CITEL gas discharge tubes comply with the specifications of main telecom operators and with the ITU-T K12 international recommendation and standards IEC 61643-311.
CITEL gas discharge tubes are also compliant with the RoHS Directive

GAS DISCHARGE TUBES

MECHANICAL CHARACTERISTICS

CITEL gas discharge tubes are available in several mechanical configurations to adapt to mounting on:

- Bare version for mounting adapted support
- "S" version wire output (diameter 0.8 or 1 mm) for mounting on printed circuit
- "SMD" version for surface mounting, with optional "SQ" version (anti-roll square electrode).
- Specific versions: output by cable or rod

Surface mounting

Most of CITEL range of gas discharge tubes are available for surface mounting (SMD), with optional "anti-rolling" version with square electrode (SQ). The welding profile with reflow must follow the recommended curve (opposite).

The 3-poles BMSQ CMS FL gas tube is particularly adapted to surface-mount technology, with its "anti-rolling" electrode and its exclusive external short-circuit system adapted to this type of mounting.

Printed circuit mounting

The majority of CITEL gas discharge tube ranges are available with wire output (diameter 0.8 or 1 mm) for mounting on a printed circuit board. Different types of output possible according to the range: axial, radial, straight output, folded output..... Wave solder mounting must be done following the recommended profile (opposite)

Radial Taping

The CITEL gas discharge tubes with wire output are provided in a radial tape in a pack of 500 components according to the ranges (plan opposite) and in line with the IEC 286-1 specification.

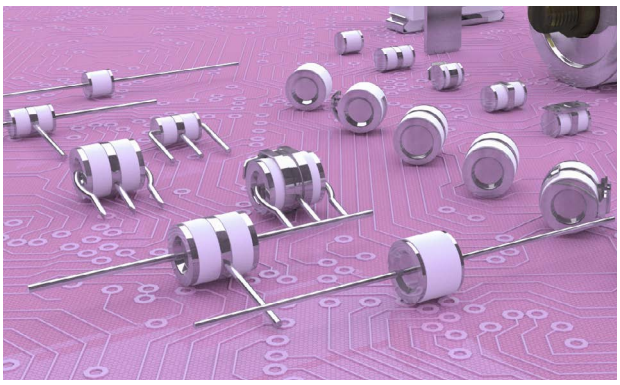
Tape and Reel

The CITEL SMD gas discharge tubes with SMT mounting are provided in a Tape and Reel pack, reel of 500, 800 or 1000 components (plan opposite) and in line with the IEC 286-1 specification

THE CITEL LINE

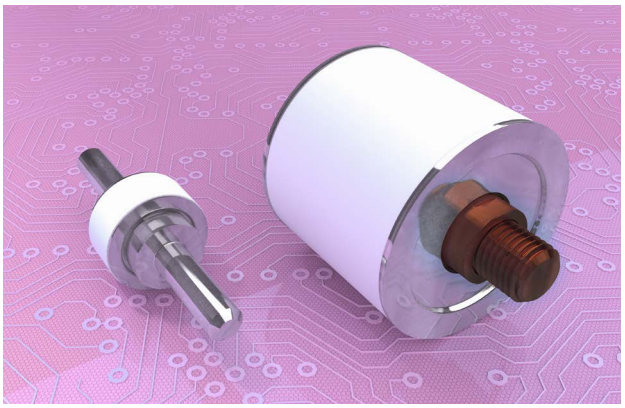
CITEL proposes a full line of gas discharge tubes to meet most configuration needs and specifications found on the market :

- 2- and 3-electrode gas discharge tubes
- Sparkover voltages from 75 to 3000 V
- Discharge capacities from 5 to 150 kA (8/20µs)
- Optional external short-circuit device
- Installation on support, on printed circuit, or surface-mounted devices.

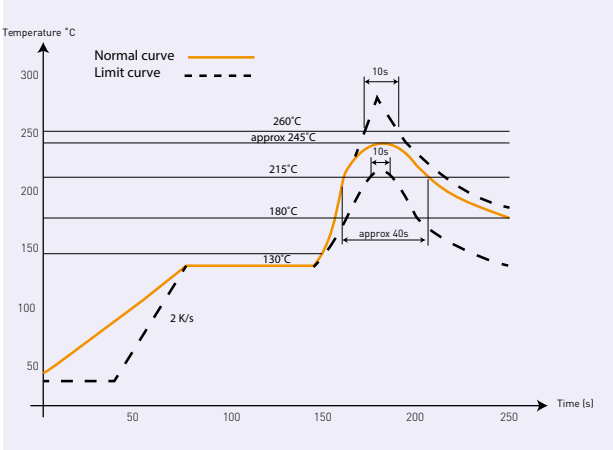


GSG SERIES

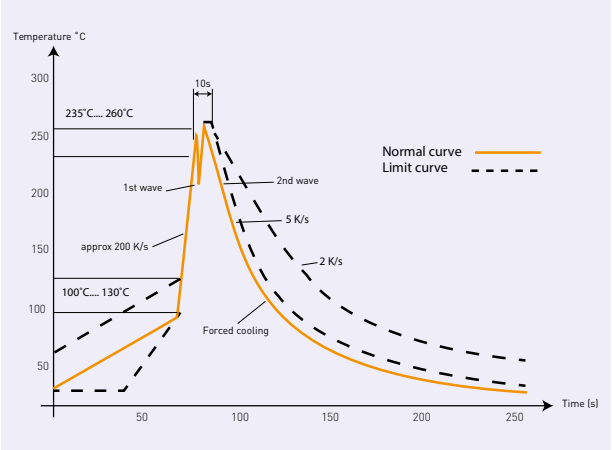
Thanks to our inherent knowledge and experience in the field of gas discharge tubes, CITEL has developed a specific technology: **GSG** (**G**as-filled **S**park **G**ap).
These components are designed to be used on an AC network: they have an increased extinction capability and a higher current discharge capability with either a 8/20us or 10/350us waveform.
The GSG components are the heart of the VG technology which insures equal performances to all air gap technologies without any of their downsides..



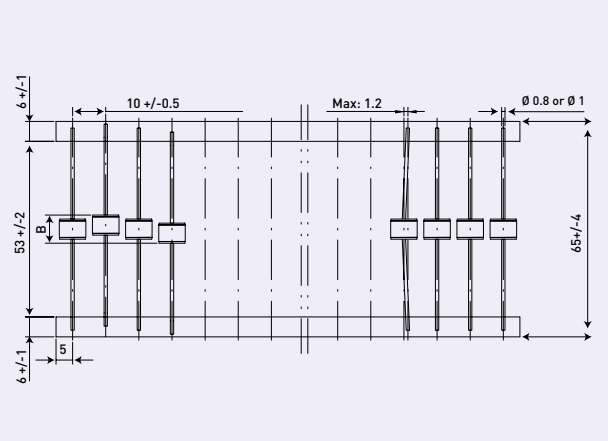
Welding curve by reflow for SMT gas discharge tubes



Wave soldering cycle for gas discharge tubes



Radial Taping layout for gas discharge tubes with wire output (IEC 286-1)



Tape & Reel for gas discharge tubes with SMD mounting (IEC 286-3)

Company history

OBSTA, a subsidiary of CITEL group is part of an industrial group that engineers, manufactures and sells obstruction lights for transmission lines, telecom, broadcasting towers and all kind of obstacle to air navigation since more than 30 years. Our obstruction lights are manufactured by us compliant with ICAO annex 14 chapter 6 (International Civil Aviation Organization) recommendations and the FAA (Federal Aviation Administration).
OBSTA has manufacturing facilities in France and has sales offices located in France, Germany, USA, and China through Citel.
